# 1. Introduction

The International Association of Oil and Gas Producers (IOGP) has been collecting global safety incident data from Member Companies since 1985. The data collected are entered directly to the IOGP safety database, which is the largest database of safety incident statistics in the industry. **These data are held securely within IOGP's systems, and all data is completely anonymized, removing all individual, company, and unique identifier references before publishing.**

The principal purpose of the data collection is to annually record and analyse the global event and incident statistics of IOGP Member Companies in the areas of occupational safety, process safety, and motor vehicle safety. The annual reports produced provide the information required to analyse industry incident trends, benchmark performance and identify subject areas and activities where focused efforts can be made to affect the greatest improvements.

The International Regulator's Forum, an organization of 10 leading regulators from Australia, Brazil, Canada, Denmark, Mexico, The Netherlands, New Zealand, Norway, the United Kingdom and the United States of America, as well as observers from Ghana and Ireland regulatory bodies, attended their Annual General Meeting in Aberdeen on the 4th, 7-8th June 2018. After this meeting they called upon the industry to improve sharing of safety data:

"The opportunity for the next step change in safety performance appears to be in a substantial increase in the sharing of data across industry. Leading practices in other industries (i.e., transportation) may be adopted in the oil and gas industry to similar effect. This builds upon the theme that was expressed during the Safety30 conference, held in conjunction with Oil and Gas UK and reflecting the 30th anniversary of the 167 lives lost on the Piper Alpha catastrophe. **The IRF calls upon industry to recognize the value of this data sharing in the improvement in safety performance and take this on as a priority by the board and CEOs of the respective industry companies.**" IRF Communiqué 8th June 2018

**"IRF members called upon industry leaders in their vital role of exercising executive oversight and accountability to ensure worker safety."** IRF Communiqué 17th July 2023

The open sharing of incident and accident data is essential for learning if we are to eliminate fatalities in the upstream oil and gas industry.

The scope of the IOGP incident and event reporting system includes worldwide exploration and production (E&P) activities, onshore and offshore, for both Member Companies and their associated contractor work hours, as defined in Section 3.1. The data reported by Member Companies are consolidated and analysed in order to compute the frequency and severity of incidents and events occurring in E&P operations by region, country, function and company. A unique company identifier code is used to identify own company data and preserve company anonymity.

It should be noted that the scope of reporting and definitions in this document may deviate from other reporting schemes.

---

## 1.1 Changes to IOGP Safety Performance Reporting, 2025 Data

### **Report 2 – Fatal and permanent impairment incident reports:**

- A new field has been added: “If PI, could this incident have realistically resulted in a fatality?”

### **Report 4 – Motor vehicle crashes:**

- In accordance with the 2024 update of Report 356, Catastrophic MVC now includes incidents where there was a PI injury or a fatality.
- A new field has been added for the number of workforce PI.

### **Report 6 – Well control incidents:**

- In the 2025 update of Report 660, the new category of ‘Level 3 (MPD)’ Well Control Incident has been added.
- A new field has been added for the number of Level 3 (MPD) WCI.

Note: changes to the data request are highlighted in yellow in the report forms in Appendix 5.

## 2. Structure of reporting system

Member Companies are requested to provide their safety incident and event data using the standard forms that are described in this guide. A separate form is completed for each country in which the Member Company has operations within the scope of reporting. A glossary of terms is provided in Appendix 2 and Frequently Asked Questions are listed in Appendix 4.

### **Report 1: Occupational injuries**

Used for reporting all recordable work-related injuries, i.e., those that result in:

- a fatality
- a permanent impairment (PI),
- an injury requiring time off work (lost work day case)
- a restriction in the work performed (restricted work day case)
- an injury requiring medical treatment (medical treatment case, see Appendix 1)

### **Report 1A: Lost workday case breakdown**

Used to provide additional information on the injuries associated with lost workday cases.

The intent of gathering the detailed information is to provide industry with focus areas to work on to improve our safety performance.

### **Report 2: Fatal incidents and permanent impairments**

Used to provide additional information on work-related workforce fatalities and/or PI as a result of an injury, rather than an illness. Wherever a fatality or PI is entered in Report 1, details of the incident must be provided in Report 2, i.e., one completed Report 2 for every incident involving one or more fatalities or PI. When a fatal incident results from a Process Safety Event, details must be entered in Report 2, as well as Report 5 (or 5A for sabotage and wilful damage) and 5B for additional information.

### **Report 3: High potential events**

A high potential event is an event which could have, under slightly different circumstances, realistically resulted in a fatal incident. The intent of gathering the detailed information in Reports 2 and 3 is to maximize learning from all incidents and near misses which did or may have resulted in a fatality. Companies are requested to submit up to five of the event reports with the most useful information for industry learning. The learning from these events is not necessarily dependent on the actual outcome, therefore it is very important to provide sufficient detail on learning to be able to provide the industry with recommendations and guidance to prevent recurrence. The information reported using Reports 2 and 3 may also relate to process safety event data provided in Report 5.

#### **Report 4: Motor vehicle crashes**

Used for reporting the number and severity of motor vehicle crashes and fatalities. These data are used for industry performance benchmarking in line with the IOGP Report 365 – [\*Land Transportation Recommended Practice\*](#).

#### **Report 5: Process safety events**

Used for reporting Tier 1 and Tier 2 process safety events (PSE) according to IOGP Report 456 – [\*Process safety – recommended practice on key performance indicators\*](#).

Process Safety Upstream PSE examples are available at <https://data.iogp.org/ProcessSafety/Examples>. The IOGP publications are consistent with API Recommended Practice 754, Process Safety Performance Indicators for the Refining and Petrochemical Industries.

#### **Report 5A: Process safety events – sabotage or wilful damage**

PSE incidents related to sabotage or wilful damage are reported separately in Report 5A.

#### **Report 5B: Tier 1 Process safety event descriptions**

Report 5B is used for the submission of event descriptions for Tier 1 PSE and additional information.

#### **Report 6: Well control incidents**

Used for reporting the number of Level 1, 2, and 3 well control incidents.

#### **Report 6A: Well control incident descriptions**

Report 6A is used for the submission of event descriptions for Level 1, 2, and 3 well control incidents including barrier failures.

#### **Report 7: Permanent impairments (PI)**

Used for reporting the number of PI injuries, as defined at <https://iogp.org/fpi>.

#### **Self-assessment**

A mandatory form which is intended as an aid to validation of data submissions.

## 3. Scope of reporting and key definitions

Data are reported on a country-by-country basis for all operations where the company either:

- is the operator
- has majority or controlling interest and has an officer assigned as the senior managing director of the joint venture operation

### Joint venture operations

When the joint venture company is an IOGP Member, then the joint venture company should report.

In the case of joint ventures where the operating company is not a Member of IOGP, companies in the partnership that are IOGP Members are required to reach agreement on which company is to take the lead on reporting the relevant information.

### Joint operatorship

In case of joint operatorship where more than one operating company is an IOGP Member, in order to avoid double counting the operating companies are required to reach agreement on which operating company reports the relevant data to IOGP.

### Partner operations

Data from partnership operations (i.e., facilities for which the company owns equity but is not the operator) are excluded.

The following definitions provide the scope of reporting for incidents and events that should be included within the data submission to IOGP.

---

### 3.1 Work-relatedness definition

An injury must be considered work-related if an event or exposure in the work environment caused or contributed to the resulting condition or significantly aggravated a pre-existing injury. Work-relatedness is presumed for injuries resulting from events or exposures occurring in the work environment unless one of the following exceptions applies in its entirety:

- Occurs when an employee or contractor is present in the work environment as a member of the general public. In case of a fatality, it will be included in the 3rd party statistics.
- Results solely from voluntary participation in a wellness program or in a medical, fitness, or recreational activity, such as blood donation, physical examination, flu vaccination, exercise class, racquetball, or baseball etc. Where the activity is company-sponsored the participation must be perceived by the employee as voluntary for this exception to apply.
- Involves signs or symptoms that surface at work but result solely from a non-work-related event or exposure.

- Is solely the result of eating, drinking, or preparing food or drink for personal consumption (whether bought on the employer's premises or brought in). For example, if the employee is injured by choking on a sandwich while in the employer's establishment, the case would not be considered work-related. Note: If the employee is made ill by ingesting food contaminated by workplace contaminants (such as lead) or gets food poisoning from food supplied by the employer, the case would be considered work-related.
- Is solely the result of doing personal tasks in the work environment outside of the employee's assigned working hours.
- Is solely the result of personal grooming, self-medication for a non-work-related condition or is intentionally self-inflicted.
- Is the common cold or flu (Note: contagious diseases such as tuberculosis, brucellosis, hepatitis A, or plague are considered work-related if the employee is infected at work). Note: IOGP does not collect information on illnesses.
- Occurs during a commute from the home to the normal place of work or first stop unless the commute uses company-mandated transport.

#### **Work-relatedness – home based workers**

Injuries that occur while an employee is working at home, including work in a home office, will be considered work-related if the injury occurs while the employee is performing work for pay or compensation in the home, and the injury is directly related to the performance of work rather than to the general home environment or setting.

Note: All work-related travel performed by workers that are home-based, i.e., work from their place of residence, is considered non-commuting travel, i.e., work related.

---

## **3.2 Occupational injury definitions**

An occupational injury is any injury such as a cut, sprain, fracture, amputation, etc., which results from a work-related activity or from an exposure involving a single incident in the work environment, such as deafness from explosion, one-time chemical exposure, back disorder from a slip/trip, or insect or snake bite.

### **Fatality**

Cases that involve one or more people who died as a result of a work-related incident. 'Delayed' deaths that occur after the incident are to be included if the deaths were a direct result of the incident. For example, if a fire killed one person outright, and a second died three weeks later from lung damage caused by the fire, both shall be reported. In some cases, a delayed fatality occurs in the next calendar year after the incident. For example, if the above fire occurred on December 21, the second death from it might occur in January of the next year. All fatalities from an incident should be included in the report for the year the incident occurred.

### **Permanent impairment (PI)**

Used for reporting the number of PI injuries, as defined at <https://iogp.org/fpi>.

**Lost work day case (LWDC)**

When reporting occupational injury data (reports 1 and 1LWDC): non-fatal cases that involve a person being unfit to perform any work on any day after the occurrence of the occupational injury. "Any day" includes rest days, weekend days, leave days, public holidays, or days after ceasing employment.

**LWDC Days (No. of lost work days)**

The sum total of calendar days (consecutive or otherwise) after the days on which the occupational injuries occurred, where persons reported under LWDC (above) were unfit for work and did not work.

If LWDC days are reported at least one day must be reported for each lost workday case (LWDC).

Where absence from work extends beyond the year end, the actual or estimated days unfit for work in the following year should be added to those for the reporting year in computing the number of lost work days i.e., days unfit for work.

Days unfit for work between a fatal incident and the date of death are not included.

The maximum LWDC days reportable for each lost workday case is 180.

**Example** – Three employees were severely injured and unfit for work after their respective incidents. Employee A was unfit for 2 working days, a weekend and 2 further days. Employee B was unfit for 3 weeks, and employee C was fit for work the day after the injury but thereafter not fit for the three following days.

|                                     |   |         |
|-------------------------------------|---|---------|
| A was unfit for work for 2+2+2 days | = | 6 days  |
| B was unfit for work for 3x7 days   | = | 21 days |
| C was unfit for work for            | = | 3 days  |
| Number of days unfit for work       | = | 30 days |

This example should be reported as 3 lost work day cases and 30 lost work days.

**Restricted work day case (RWDC)**

When reporting occupational injury data (report 1): cases that do not result in a fatality or a lost work day case but do result in a person being unfit for full performance of the regular job on any day after the occupational injury.

Work performed might be:

- an assignment to a temporary job
- part-time work at the regular job
- working full-time in the regular job but not performing all the usual duties of the job

### **RWDC days (Number of days restricted work)**

Days counting as restricted work are defined as for a lost work day case (LWDC above).

### **Medical treatment cases (MTC)**

Those cases not severe enough to be reported as fatalities, lost work day cases or restricted work day cases, but are more severe than requiring simple first aid treatment. Further guidance on cases that qualify as medical treatment rather than first aid cases is given in Appendix 1.

---

## **3.3 Company/contractor activity definitions**

### **Company work-related activities**

All work by company personnel, including attendance at courses, conferences, and company-organized events where participation is perceived by the employee as mandatory, business travel, field visits, or any other activity or presence expected by the employer. Refer to the section on work-relatedness for the exemptions that apply.

### **Contractor work-related activities**

Reporting is required for all work performed by contractor personnel under the following contractual Modes 1 and 2, as defined in IOGP Report 423 – *HSE management guidelines for working together in a contract environment* published in 2017:

**Mode 1** – The contractor provides people, processes and/or equipment for the execution of the contract under the oversight, instructions, and HSE Management System of the client. The contractor has a management system to provide assurance that the personnel for whom it is responsible are qualified and fit for the work and that the processes, tools, materials and equipment they provide are properly maintained and suitable for the contract. This mode requires the contractor reports HSE performance data, including events and incidents, to the client.

Typically, this could apply to scopes of minor modification or maintenance/turnaround work on a client owned and/or operated site.

**Mode 2** – The contractor provides people, processes, equipment and/or facilities for the execution of the contract, as a main rule, under its own HSE Management System, providing the necessary instructions and oversight and verifying the proper functioning of its HSE Management System.

This mode requires interfacing or bridging with the client's HSE management system and reporting HSE performance data, including events and incidents, to the client. The client is responsible for assuring the overall effectiveness of the HSE management controls put in place by the contractor, including its interface with subcontractors, and ensuring that both the client's and the contractor's HSE management system are compatible.

This could apply to scopes of work on either contractor, client or third party owned/operated sites. The location will typically drive the level of interfacing and bridging required based on risk.

**Mode 3** – The contractor provides people, process, equipment, and/or facilities for the execution of the contract under its own oversight, instruction, and HSE management system that requires no interfacing or bridging with the client's HSE management system and is not required to report HSE performance data including events and incidents to the client. However, this does not exclude the possibility that the client may wish to guide and influence HSE performance under this type of contract; may provide product quality or environmental specifications, quality control, and acceptance testing, etc.; and/or may insist that the contractor comply with a code of conduct which addresses human rights, labour rights, corruption, etc.

Typically, this could apply to scopes of work on contractor owned/operated sites or third party sites, and include examples such as:

- manufacturing of products produced for the open market, which client purchases (e.g., vehicles)
- manufacturing of components in a factory together with the manufacture of components for other customers
- construction at contractor sites shared by other customers
- delivery of good or products to client locations by a contractor who is in business to deliver to many other companies
- activities in shared port facilities, in particular the 'international' port areas before customs clearance
- activities of military or law enforcement agencies, over which client cannot exercise control

Other Mode 3 contractors provide services that can have HSE implications to the client such that their service performance and management still require assessing prior to use and ongoing monitoring by the client.

Examples include:

- any type of non-dedicated medical services, clinic, or hospital
- catering supplied vendors
- hotels and other leased housing or office space
- taxi and limousine companies
- public transport including airlines

Note: For reporting purposes, subcontractor personnel are to be treated as if they were contractor personnel and work hours and work-related events reported as contractor events.

---

## 3.4 Personnel definitions (company/contractor/third party)

### **Company employee**

A person employed by and on the payroll of the reporting company, including corporate and management personnel specifically involved in E&P activities. Persons employed under short-service contracts are included as company employees provided they are paid directly by the company.

### **Contractor employee**

A person employed by a contractor or contractor's subcontractor(s) who is directly involved in execution of prescribed work under a Mode 1 or Mode 2 contract with the reporting company (reference Section 3.3 above).

### **Third party**

A person with no business relationship with the company or contractor. Incidents in which there are third party fatalities should be entered in Report 1, with details entered in Report 2. This third-party information will be used internally within IOGP to identify learning opportunities.

---

## **3.5 Location definitions (onshore/offshore)**

### **Onshore**

All activities and operations that take place within a landmass, including those on swamps, rivers and lakes. Land-to-land aircraft operations are counted as onshore, even though flights may be over water.

### **Offshore**

All activities and operations that take place at sea, including activities in bays, in major inland seas, such as the Caspian Sea, or other inland seas directly connected to oceans. Incidents including transportation of people and equipment from shore to the offshore location, either by vessel or helicopter, should be recorded as "offshore".

Note: Strictly speaking, the categorization under onshore or offshore refers to the physical location of the incident, and not to an individual's normal place of work. However, where this is administratively difficult, it is acceptable to record an incident as happening at the location where the work hours are recorded, even though the incident physically happened elsewhere. For example, a mechanic who normally works onshore is called offshore for a repair job lasting 2 days. Whilst offshore, the mechanic suffers an injury resulting in a lost workday. If the mechanic's work hours are counted as onshore hours, even though he was physically offshore, then the LWDC should be counted as an onshore incident. The same principle applies for personnel who travel internationally; the incident should be assigned to the geographic location where their work hours are allocated.

---

## **3.6 Work function definitions**

### **Exploration**

Covers geophysical, seismographic and geological activities, inclusive of administrative and engineering aspects, maintenance, materials supply, and transportation of personnel and equipment. Exploration drilling is to be included under "drilling". Exploration activities fall outside the scope of Report 5 for asset integrity/process safety events.

## Drilling

Includes all exploration, appraisal and production drilling, wireline, completion and workover as well as their administrative, engineering, construction, materials supply and transportation aspects. It includes site preparation, rigging up and down and restoration of the drilling site upon work completion.

## Production

Covers petroleum and natural gas production operations, including administrative and engineering aspects, repairs, maintenance and servicing, materials supply and transportation of personnel and equipment. It covers all mainstream production operations:

The production work function includes:

- work on producing or injection wells under pressure
- oil (including condensates) and gas extraction and separation (primary production)
- heavy oil production where it is inseparable from upstream (i.e., steam assisted gravity drainage) production
- primary oil processing (water separation, stabilization)
- primary gas processing (dehydration, liquids separation, sweetening, CO<sub>2</sub> removal)
- floating storage units (FSUs) and sub-sea storage units
- gas processing activities with the primary intent of producing gas liquids for sale
- secondary liquid separation (i.e., natural gas liquids [NGL] extraction using refrigeration processing)
- liquefied natural gas (LNG) and gas to liquids (GTL) operations including regasification
- flow-lines between wells and pipelines between facilities associated with field production operations
- oil and gas storage and loading facilities, including land or marine vessels (trucks and ships) when connected to an oil or gas production process
- pipeline operations (including booster stations) operated by company E&P business

Note for PSE reporting includes production facility construction activities on brownfield sites where equipment is connected to the operational process. See PSE examples for construction activities on active production sites at <https://data.iogp.org/ProcessSafety/Examples>.

The production work function excludes:

- production drilling or workover operations
- mining processes associated with oil sands extraction up to the point where the ore becomes a slurry
- tailings processes associated with oil sands extraction
- secondary heavy oil processing (upgrading)
- refineries (see API RP 754)

Note: For PSE reporting production facility construction activities exclusion: Equipment is in the installation phase but has not yet been commissioned or connected to the operational process. To qualify for exclusion, the equipment must be completely disconnected from the process and contain no threshold materials.

Note: For PSE reporting decommissioning activities exclusion: Equipment/systems/ pipework must have been fully decontaminated, disconnected from the operational process (including all valves, piping, and related components), and contain no threshold materials.

See PSE examples for construction and decommissioning activities on active production sites at <https://data.iogp.org/ProcessSafety/Examples>.

### **Construction**

Includes all construction, fabrication activities and disassembly, removal, and disposal (decommissioning) at the end of the facility life. Construction activities under contracting Modes 1 and 2 shall be reported, as defined in the contractor work activities below. Construction of process plant, fabrication yard construction of structures, offshore installation, hook-up and commissioning, and removal of redundant process facilities are all examples to be included. Construction activities fall outside the scope of Report 5 on asset integrity/process safety events. See PSE examples for construction activities on active production sites at <https://data.iogp.org/ProcessSafety/Examples>.

### **Unspecified**

Should be used for the entry of data associated with office personnel whose work hours and incident data cannot be reasonably assigned to the administrative support of one of the function groupings of exploration, drilling, production or construction. Corporate overhead support function personnel such as finance or human resources staff may be examples where work hours cannot be specifically assigned to a particular function.

Injuries occurring in seismic and drilling camps or on offshore platforms during off-duty hours should not be included unless they are work-related, i.e., caused by other personnel who are at work.

---

## **3.7 Work hours**

### **Hours worked (000s)**

The actual 'hours worked', including overtime hours, are recorded in the case of onshore operations. The hours worked by an individual will generally be about 2000 per year.

For offshore workers, the 'hours worked' are calculated on a 12-hour work day. Consequently, average hours worked per year will vary from 1600 to 2300 hours per person depending upon the on/off shift ratio. Vacations and leaves are excluded.

---

## **3.8 Body part injured**

The following list should be used for the reporting of lost work day cases, permanent impairment cases and fatal incident descriptions.

- arm/elbow/shoulder
- brain
- ear(s)
- eye(s)

- feet/ankle
- fingers/thumb
- hand/wrist
- head (incl. mouth)
- genitalia or other sexual organs
- internal organs (can be used for injuries involving electrocution, asphyxiation or exposure to toxic materials/gases)
- leg/knee/hip
- neck/torso/spine
- respiratory system (can be used for injuries involving electrocution, asphyxiation, exposure to toxic materials/gases or drowning)
- psychological injury
- toes

---

### 3.9 Nature of injury

The following list should be used for the reporting of lost work day cases, permanent impairment cases and fatal incident descriptions.

- amputation
- bite, sting, animal attack/allergic reaction
- bruise or contusion
- burn
- chemical or physical irritation or exposure
- concussion
- crushing
- cut, Puncture, Scrape
- decompression illness
- electric shock
- fracture
- hearing loss or damage
- inhalation, poisoning, intoxication, asphyxiation, drowning
- loss of consciousness
- loss of cognitive function/ brain injury (e.g., resulting in seizures/epilepsy)
- major/multiple system trauma
- nerve damage/loss of musculoskeletal function/ mobility impairment
- organ function/loss or damage
- paralysis
- permanent disfigurement
- psychological trauma
- sensory loss/damage (e.g., hearing, sight, taste, smell)
- shot

- sprain, strain
- temperature-related – cold
- temperature-related – heat
- vibration-related

---

### 3.10 Incident/event causes

The following list should be used for the reporting of lost work day cases, permanent impairment cases and fatal incident and high potential event descriptions. See Appendix 2 – Glossary of general terms for definitions.

- aviation accidents
- assault or violent act
- caught in, under, or between (excl. dropped object)
- confined space
- cut, puncture, scrape
- dropped objects
- explosions, fire, or burns
- exposure: electrical
- exposure: noise, chemical, biological, vibration, radiation
- falls from height
- overexertion/strain
- pressure release
- slips and trips (at the same height)
- struck by (excl. dropped object)
- water-related, drowning

---

### 3.11 Type of activity

The following list should be used for the reporting of lost work day cases and fatal incident and high potential event descriptions. See Appendix 2 – Glossary of general terms for definitions.

- construction, commissioning, decommissioning
- diving (including decompression), Subsea, ROV
- drilling, workover, well operations
- excavation, trenching, ground disturbance
- lifting, crane, rigging, deck operations
- maintenance, inspection, testing
- office, warehouse, accommodation, catering
- production operations
- seismic/survey operations
- transport – air

- transport – land
- transport – water, including marine activity
- unspecified – other

---

## 3.12 Causal factors

The following list of causal factors should be used for Reports 2, 3, 5B, and 6A.

Further guidance has been provided in **Appendix 3 – Glossary** of causal factors to assist the user of the IOGP list of causal factors, to further define and explain the classifications. Since the causal factors selected will be used for trend analysis, it is important to accurately select the appropriate cause. Users are encouraged to use Appendix 3 to ensure they fully understand each cause category.

### PEOPLE (ACTS)

The “People (Acts)” causal factors involve either the actions of a person or actions which were required but not carried out or were incorrectly performed. There are four main categories, with an additional level of detail under each.

#### Following Procedures:

Deviation intentional (by individual or group)  
Deviation unintentional (by individual or group)  
Improper position (in the line of fire)  
Overexertion or improper position/posture for task  
Work or motion at improper speed  
Improper lifting or loading

#### Use of tools, equipment, materials and products:

Improper use/position of tools/equipment/materials/products  
Servicing of energized equipment/inadequate energy isolation

#### Use of protective methods:

Failure to warn of hazard  
Inadequate use of safety systems  
Personal Protective Equipment not used or used improperly  
Equipment or materials not secured  
Disabled or removed guards, warning systems or safety devices

#### Inattention/lack of awareness:

Improper decision making or lack of judgement  
Lack of attention/distracted by other concerns/stress  
Acts of violence  
Use of drugs or alcohol  
Fatigue

## PROCESS (CONDITIONS) CLASSIFICATIONS

Process (conditions) classifications usually involve some type of physical hazard or organizational aspect out with the control of the individual. There are four major classification categories, with an additional level of detail under each of the major categories.

### Protective Systems:

- Inadequate/defective guards or protective barriers
- Inadequate/defective Personal Protective Equipment
- Inadequate/defective warning systems/safety devices
- Inadequate security provisions or systems

### Tools, equipment, materials, products:

- Inadequate design/specification/management of change
- Inadequate/defective tools/equipment/materials/products
- Inadequate maintenance/inspection/testing

### Work place hazards:

- Congestion, clutter or restricted motion
- Inadequate surfaces, floors, walkways or roads
- Hazardous atmosphere (explosive/toxic/asphyxiant)
- Storms or acts of nature

### Organizational:

- Inadequate training/competence
- Inadequate work standards/procedures
- Inadequate hazard identification or risk assessment
- Inadequate communication
- Inadequate supervision
- Poor leadership/organizational culture
- Failure to report/learn from events

---

## 3.13 Life-Saving Rules

The following list of Life-Saving Rules should be used for the reporting of fatal incidents and high potential events. This list represents Life-Saving Rules which are described in more detail in Report 459 – [IOGP Life-Saving Rules](#). The most specific Life-Saving Rule should be selected.

### Bypassing safety controls

- Obtain authorization before overriding or disabling safety controls

### **Confined space**

Obtain authorization before entering a confined space

### **Driving**

Follow safe driving rules

### **Energy isolation**

Verify isolation and zero energy before work begins

### **Hot work**

Control flammables and ignition sources

### **Line of fire**

Keep yourself and others out of the line of fire

### **Safe mechanical lifting**

Plan lifting operations and control the area

### **Work authorization**

Work with a valid permit when required

### **Work at height**

Protect yourself against a fall when working at height

### **Other**

Any other issue not covered by a Life-Saving Rule

### **Unspecified**

Information either not available or reporting organization has chosen not to assign a Life-Saving Rule.

## **3.13.1 Line of fire barrier**

- electrical equipment/exposure
- machinery and tools
- mechanical lifting/hoisting
- moving vehicles/mobile equipment
- natural phenomenon/extreme weather
- not applicable
- objects with uncontrolled roll, slide, or fall potential
- pressurized or vacuum systems/equipment

- projectiles/explosion/fire
- tensioned lines/spring loaded devices/stored energy
- working at height/falling objects

---

### 3.14 Motor vehicle crash definitions

The scope for the reporting of motor vehicle crashes (MVC) to IOGP applies to employees, contractors and their subcontractors and covers all light vehicles, mobile construction equipment (bulldozer, earthmoving equipment etc.), and heavy vehicles including buses or coaches. Reference IOGP Report 365 - [Land transportation safety practice](#), for reporting guidance and definitions.

Upstream examples for motor vehicle crash classifications are provided at <https://data.iogp.org/Vehicle/MvcExamples>.

#### Exclusions from reporting

The following should not be reported as a motor vehicle crash when the vehicle is properly parked:

- injuries that occur when entering or exiting the vehicle
- any event involving loading or unloading from the vehicle
- another vehicle crashes into the parked vehicle

In addition, the following should not be reported as a motor vehicle crash:

- damage to or total loss of a vehicle solely due to environmental conditions or vandalism damage related to the theft of a vehicle
- superficial damage, such as a stone/rock chip damaging a windscreen/or paintwork, while the vehicle is being driven
- an event where there has been no collision or any other damage than to the vehicle itself, this includes but not limited to: engine fire, losing a wheel and brake failure while maintaining control of the vehicle

#### MVC work-relatedness

Any crash involving a vehicle while performing company business.

Note: Work-relationship is presumed for crashes resulting from business being conducted on behalf of the company while operating a company assigned vehicle. Examples of company business include driving a client to the airport, driving to the airport for a business trip, taking a client or work colleague out for a meal, deliveries, visiting clients or customers, or driving to a business-related appointment. Personal business which should not be counted includes, but is not limited to, personal shopping, getting a meal by yourself, commuting to and from home, or driving to a private medical appointment.

#### Motor vehicle crash (MVC)

A work-related motor vehicle incident, e.g., collision or other event), which resulted in vehicle damage, vehicle rollover, personal injury, or fatality.

Note: Contractor motor vehicle crash includes any vehicle operated by a contractor or subcontractor while performing work on behalf of the company, where injuries, kilometres driven, or hours worked should be recorded (e.g., delivery/courier services are excluded).

### **Motor vehicle**

Any mechanically powered vehicle used to transport people or property, including any load on or attached to the vehicle (e.g., a trailer). This includes motorcycles. Specifically excluded from the definition of motor vehicle are vehicles operated on fixed rails and onsite vehicles that are not capable of more than 10 mph (16 kph).

Vehicles are split into four sub-categories:

- heavy vehicle (HV)
- light vehicle (LV)
- mobile equipment
- motorcycles

### **Rollover [From IOGP Report 365]**

Any crash, at any speed, where the vehicle has flipped onto any of its sides (90 degrees), top, and/or rolled 360 degrees via any axis.

Note: If a vehicle lands on its side but has flipped less than 90 degrees due to vehicle design, load, or elevation of the road (or side of the road), it is still considered a rollover. If a vehicle tips less than 90 degrees but then recovers (all wheels back on the ground), or if a vehicle flat spins around the vertical axis (such as a quick turning movement round and round), it is not considered a rollover.

For the purposes of MVC reporting, the term Vehicle includes the trailer. If, for example, the cab/tractor stays upright while the trailer rolls over, this is considered a rollover.

### **Commuting**

- Travel from home to first work site and travel from last work site to home.
- Travel between a worker's identified work location and any location for personal business, including a restaurant.
- Travel between a worker's established 'home away from home' to the first worksite or to any location for personal business, including a restaurant.
- Travel between home and a non-company event, e.g., local conference or other similar function.

### **Commute travel**

For injury/illness reporting, commute travel begins when the worker is seated in the vehicle in preparation for departure and ends when the worker arrives at their home or worksite and the vehicle is placed in park or taken out of gear. For MVC reporting, commute travel begins when the worker is no longer driving on company business.

Note: Travel to and from field operations locations is considered to be company business travel.

A vehicle crash is considered to have occurred during commute travel if it meets the definition above, regardless of whether the event occurs while driving a company or personal vehicle or whether the employee or contract employee is being compensated during this time. Where appropriate, any vehicle crash occurring during commute travel may be considered as asset or property damage but not as an MVC.

Note: All work-related travel performed by workers that are home-based, i.e., work from their place of residence, is considered to be company business travel.

### Home-away-from-home

When travelling, workers establish a 'home away from home' when checked into a hotel, motel, or other similar temporary residence.

Travel directly to the temporary residence before check-in from the airport (train station, etc.) or rental car agency and travel direct from home to the temporary residence is considered business travel, when on work-related business.

Travel home directly from the temporary residence after checkout to the airport (train station, etc.) or rental car agency and travel direct to home from the temporary residence is considered business travel, when on work-related business.

Company mandated accommodation is not considered to be home away from home. This is considered to be a field operations location therefore travel to and from such locations is considered to be company business travel and not a commute.

---

## 3.15 Process safety event definitions

### Process safety event (PSE)

Reportable PSE are classified as Tier 1 or 2 based on whether a loss of primary containment (LOPC) event meets or exceeds defined consequences or release thresholds (see Reports 5, 5A and 5B for detail of PSE data to be recorded).

As specified within IOGP Report 456 – [Process safety – recommended practice on key performance indicators](#), a process safety event is a LOPC from a process, and is reportable as Tier 1 or Tier 2 if:

- i. the consequence was a reportable employee or contractor injury or fatality, a third party hospital admission or fatality, a community or site evacuation or a fire/explosion
- ii. a material release or pressure relief device discharge occurs which exceeded defined thresholds (even if none of the consequences above occurred)

IOGP Report 456 provides consequence and threshold definitions consistent with API Recommended Practice No.754, as well as indicator definitions and consequences for both Tier 1 PSE and Tier 2 PSE, together with respective tables of material release threshold quantities. Note that "days away from work" injury should be taken to be the same as the IOGP-defined LWDC.

Upstream PSE examples are provided at <https://data.iogp.org/ProcessSafety/Examples>.

Work-relatedness is not generally a factor when determining whether a process safety event is recordable based on a fatality or injury consequence.

Note: Changes to definitions and examples published in Report 456, 3rd revision (2023), should be applied for 2024 data onwards.

### Report 5A

Process safety events due to sabotage or wilful damage are reported separately in Report 5A as the control required for sabotage and wilful damage events are generally more related to security rather than process safety.

### Report 5B

Tier 1 process safety events are reported in Report 5B to provide information required to further enable learning from these events. This includes selections from a range of dropdown lists and the following free text fields:

- narrative description
- what went wrong – including aspects of human performance, equipment failures, and equipment/system design issues
- corrective actions and recommendations

The following lists should be used for the reporting of Tier 1 PSE descriptions. See IOGP Report 456 – [Process safety – recommended practice on key performance indicators](#), and Appendix 2– Glossary of general terms for definitions.

#### Incident category

- An employee, contractor or subcontractor ‘days away from work’ injury and/or fatality.
- A hospital admission and/or fatality of a third party.
- An officially declared community evacuation or community shelter-in-place including precautionary community evacuation or community shelter-in-place.
- A fire or explosion damage greater than or equal to \$100,000 of direct cost.
- An engineered pressure relief (e.g., use of a pressure relief device (PRD), safety instrumented system (SIS), or manually initiated emergency depressurization) discharge, of a quantity greater than or equal to the threshold quantities in Report 456, Part E, in any one-hour period, to atmosphere whether directly or via a downstream destructive device that results in one or more of the following four consequences. The threshold quantity determination is made at the discharge of the engineered PRD, while the consequence is determined when the material reaches atmosphere whether directly or via a downstream destructive device:
  - rainout
  - discharge to a potentially unsafe location
  - an onsite shelter-in-place or on-site evacuation, excluding precautionary on-site shelter-in-place or on-site evacuation
  - public protective measures (e.g., road closures) including precautionary public protective measures

- An upset emission from a permitted or regulated source, of a quantity greater than or equal to the threshold quantities in Report 456, Part E, in any one-hour period, that results in one or more of the following four consequences:
  - rainout
  - discharge to a potentially unsafe location
  - an on-site shelter-in-place or on-site evacuation, excluding precautionary on-site shelter-in-place or on-site evacuation
  - public protective measures (e.g., road closures) including precautionary public protective measures
- An unignited release of material greater than or equal to the threshold quantities described in Report 456, Part E, in any one-hour period, excluding engineered pressure-relief discharges and upset emissions from permitted or regulated sources.

Note: Non-toxic and non-flammable materials (e.g., steam, hot water, nitrogen, CO<sub>2</sub> and compressed air) have no threshold quantities and are only included in this definition as a result of their potential to result in one of the other consequences.

### Type of activity

- drilling
- completions
- workover/well services
- production operations
- pipeline operations
- unspecified – other

### Mode of operation

#### Production

- start-up
- planned shutdown
- emergency shutdown
- normal
- upset
- turnaround
- routine maintenance
- temporary
- other

#### Drilling and completion operations

- drilling
- completions
- well intervention/well servicing
- well flow testing
- abandonment
- recompletion

### Type of drilling operation

- Conventional: Conventional reservoirs are those in which wells can be drilled so that oil and natural gas can be produced at economic flow rates without large stimulation treatments or any special recovery process. Includes oil sands. [Source: SPE]
- Unconventional: An unconventional reservoir is one that cannot be produced at economic flow rates or that does not produce economic volumes of oil and gas without the assistance of massive stimulation treatments or special recovery processes and technologies. [Source: SPE]

### Type of facility

- offshore – platform – fixed
- offshore – platform – floating
- offshore – platform – wellhead
- offshore – FPSO-FSO
- offshore – drill rig (e.g., drillship, MODU, jack-up)
- offshore – pipeline
- offshore – subsea wellhead
- offshore – other subsea asset
- offshore – other
- onshore – plant/production facility
- onshore – storage facility/tank battery
- onshore – well pad without production facilities
- onshore – pipeline
- onshore – rig
- onshore – other

### Age of facility (optional)

- < 10 years
- 10 – 25 years
- 26 – 40 years
- > 40 years

### Point of release

Refer to Appendix 7 for definitions.

### Piping in process and utility systems (excluding subsea)

- piping joint
- piping material/tubing
- valve (body, stem, plugs)
- choke
- instrumentation and small bore tubing
- sight glass
- platform/well pad flowline
- flexible hose/piping

### Equipment

- pressure vessel
- pig launcher/receiver
- pump
- compressor/blower/fan
- meter
- filter
- fired heater/boiler/furnace
- power generation unit
- reactor
- heat exchanger

### Tanks and sumps/pits

- atmospheric tank
- atmospheric tank overflow
- pressurized storage vessel
- sump/pit overflow

### Relief, vent and discharge systems

- relief valve (body, plugs)
- flare and atmospheric vent systems (intended discharge location)
- flare and atmospheric vent systems (not at intended discharge location)
- drain
- discharge to sea

### Breaking containment locations

- breaking containment location
- loading/unloading coupling
- sample system
- piping/valve (inadvertently left) open to atmosphere

### Wells, drilling and intervention

- well
- subsea well
- well intervention equipment
- mud circuit/tanks

### Subsea

- subsea pipeline/flowline
- subsea equipment

### Onshore pipelines/flowlines

- onshore pipeline
- onshore flowline

### Unknown/insufficient information

- unknown/insufficient information

### Barrier failures

In order to conduct analysis on Tier 1 PSEs, additional information is requested on the hardware, human and management system barrier failures in accordance with the categories shown below. Refer to IOGP Report 456 – [Process safety – Recommended practice on Key Performance Indicators](#), and IOGP Report 544 – [Standardization of barrier definitions](#).

#### Hardware barrier failures

Primary containment, process equipment, and engineered systems designed and managed to prevent process safety events and mitigate any potential consequences of such events.

1. structural integrity
2. process containment
3. ignition control
4. detection systems
5. protection systems – including deluge and fire water systems
6. shutdown systems – including operational well isolation and drilling well control equipment
7. emergency response equipment and systems
8. life-saving equipment – including evacuation systems

#### Human barrier failures

These barriers rely on the actions of competent people capable of carrying out activities designed to prevent process safety events and mitigate any potential consequences of such events.

1. operating in accordance with procedures – PTW, isolation of equipment, overrides and inhibits of safety systems, shift handover, etc.
2. surveillance, operator rounds, and routine inspection
3. authorization of temporary and mobile equipment
4. acceptance of handover or restart of facilities or equipment
5. response to process alarm and upset conditions (e.g., outside safe envelope)
6. response to emergencies

Note: Human barriers exclude maintenance and inspection (M&I) activities associated with hardware barriers. M&I are management system elements.

#### Management system element barrier failure\*

Management system elements designed to prevent process safety events and mitigate any potential consequences of such events. Management system elements support hardware and human barriers.

- Element 1 – commitment and accountability
- Element 2 – policies, standards, and objectives
- Element 3 – organization, resources, and capability
- Element 4 – stakeholders and customers
- Element 5 – risk assessment and control
- Element 6 – asset design and integrity
- Element 7 – plans and procedures
- Element 8 – execution of activities
- Element 9 – monitoring, reporting, and learning
- Element 10 – assurance, review, and improvement

\*Reference IOGP Report 510 - [\*Operating Management System Framework for controlling risk and delivering high performance in the oil and gas industry\*](#)

### **Process safety fundamental**

One process safety fundamental is assigned to each Tier 1 PSE narrative and for each high potential event narrative where the event was also PSE or PSE-related. Refer to IOGP Report 638 - [\*Process Safety Fundamentals\*](#) for more details.

- We respect hazards.
- We apply procedures.
- We sustain barriers.
- We stay within operating limits.
- We maintain safe isolation.
- We walk the line.
- We control ignition sources.
- We recognize change.
- We stop if the unexpected occurs.
- We watch for weak signals.

---

## **3.16 Well control incident reporting definitions**

The scope of reporting is applicable to well operations\*, which include rig and rig-less activities related to well construction (e.g., exploration, appraisal, development well drilling and completions), interventions and workovers (e.g., wireline, stimulation, coiled tubing) and abandonment. It is not applicable to injection and production operations.

A WCI that results in an unplanned release from the well should also be assessed for its potential PSE Tier classification.

For definitions of well barrier element and well barrier envelope, see Glossary.

### **Definition of a well control incident**

A well control incident (WCI) occurs when there is a failure or degradation of the defined well barrier envelope(s) that are designed and managed to keep fluids in the well or the reservoir.

The WCI levels are a measure of deviation from the general principle of operating with two well barrier envelopes whenever there is the potential for flow.

The robustness of process safety in well operations\* can be assessed by recording the number and classification level of WCIs.

A Level 1 WCI reflects a failure or degradation of the well barrier envelopes and consequently there is uncontrolled flow:

- at surface into the atmosphere in a surface well blowout, or
- at the mudline for subsea wells, or
- into another downhole formation resulting in an underground blowout

\*Well operations: All well activities related to well construction (e.g., exploration, appraisal, injection, production drilling and completions), well testing, surveillance, interventions and workovers (e.g., wireline, stimulation, coiled tubing), and abandonment (including downhole plugging and temporary abandonment).

See Reports 660 – [Well Control Incident Definitions](#) for definitions and worked examples. Also see Report 456 – [Process safety – recommended practice on key performance indicators](#).

### Classification system for well control incidents (WCIs)

IOGP has defined the following classification system for WCI reporting: WCIs of Levels 1, 2, 3 and 3 (MPD) are reportable to IOGP.

#### WCI Level 1 – Loss of well control

A failure of the well barrier envelopes resulted in uncontrolled flow from the well to surface, seabed, or, via underground communication, to another formation or well.

#### WCI Level 2 – Complicated well control

One or more well barrier envelopes failed. The remaining well barrier envelope still had pressure integrity but may have been degraded, operated outside its design capacity, or complications resulted in escalation of the response.

Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.

#### WCI Level 3 – Routine well control

One or more well barrier envelopes failed. A single planned and tested barrier envelope remained. The remaining well barrier envelope operated within its design capacity and has operated as expected. Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.

#### WCI Level 3 – Managed Pressure Drilling (MPD) Influx Management

An unplanned influx that is controlled within the normal functioning and operating limit of the MPD system.

Any influx due to a failure of procedures, including planning, people, or equipment, or if the secondary well barrier has been activated, is a WCI Level 3 – Routine WCI.

Incidents that fit the criteria for both PSE and WCI should be reported in both forms.

Note: Changes to definitions and examples published in IOGP Report 660 (Version 2, 2025) should be applied for Well Control Incident data for 2025 onwards. Changes to definitions and examples published in IOGP Report 456, 3rd edition (2023), should be applied for 2023 data onwards.

### **Type of activity**

WCI are categorized by type of activity as follows:

- drilling
- completion
- well intervention/well servicing
- well flow testing
- abandonment
- recompletion

### **Barrier failures**

#### **Hardware Barrier failures**

1. detection systems
2. hydrostatic barrier
3. inner drill string barrier
4. BOP system
5. station keeping system
6. casing
7. completion element
8. cement
9. wellhead – christmas tree
10. well collision

#### **Human barrier failures**

1. operating in accordance with programs or procedures
2. monitoring of well: well returns, fill up when tripping, well surveillance during other works
3. acceptance of handover, pre-tour check lists
4. drill crew training and drills
5. calculation of hydrostatic barrier fluid weight
6. wrong usage of equipment
7. inflow testing of barriers
8. response to alarms, interpretation of P readings and trends
9. other drilling practices

### Management system element\* barrier failure

Management system elements designed to prevent process safety events and mitigate any potential consequences of such events. Management system elements support hardware and human barriers.

Element 1 – commitment and accountability

Element 2 – policies, standards, and objectives

Element 3 – organization, resources, and capability

Element 4 – stakeholders and customers

Element 5 – risk assessment and control

Element 6 – asset design and integrity

Element 7 – plans and procedures

Element 8 – execution of activities

Element 9 – monitoring, reporting, and learning

Element 10 – assurance, review, and improvement

\*Reference IOGP Report 510 – [\*Operating Management System Framework for controlling risk and delivering high performance in the oil and gas industry\*](#)

---

## 3.17 Fatality and permanent impairment

For full definitions, examples and FAQs refer to <https://iogp.org/fpi>. For 2023 data onwards, actual permanent impairment injuries are reportable.

---

## 3.18 Reporting boundaries

### Definition

For the purposes of this document, “reporting boundaries” are used to help determine which activities and events should be monitored and considered for reporting. Even if a worker, facility, or equipment is determined to be within the company’s reporting boundaries, the potentially reportable incident or event shall be evaluated for other criteria (e.g., work-related, treatment beyond first aid). See Section 3.1 for details and exceptions.

### Determining local reporting boundaries

Decisions pertaining to whether an activity or operation is within reporting boundaries should be determined, documented, communicated and understood by the parties involved. In the case of contractor activities, these determinations shall be made prior to executing the work agreement. In most cases, these determinations will be documented as part of a service contract or operating agreement. Reporting units shall use the guidance in the following sections to help make specific determinations on local Reporting Boundaries. These determinations should identify:

- which locations are considered Company premises and what are the commonly understood physical boundaries of these premises

- on-premises activities typically not considered to be within Reporting Boundaries
- off-premises activities typically considered to be within Reporting Boundaries

These determinations shall be documented and used as a guide when:

- setting up data tracking systems, such as those used to track hours worked and distance driven
- during incident investigations and classification for reporting in accordance with this User Guide

## SCOPE

### In Scope

#### *Company employees*

- company employees
- company secondees on assignment to non-operated joint ventures

#### *Contract employees*

- Contract employees as per Mode 1 and 2 as defined in IOGP Report 423 – [HSE Management – Guidelines for working together in a contract environment](#).
- Contract employees on company premises, except as noted in the out of scope section below.
- Contract employees travelling in company-provided vehicles, watercraft and aircraft (company-dedicated or shared-service). In the context of this scope, company-provided means that the operating company arranged and paid for transportation in vehicles owned by a contractor, and contract employees are expected to use the transportation as a condition of their work assignment. This excludes commercial (public) transportation that the company reimburses but does not arrange.
- Contract employees acting in functions, such as inspectors, negotiators and drilling representatives for the company. These contract employees are in scope both on and off premises as long as they are on company business.

#### *Equipment and transporters*

- Equipment and transport operations (equipment, cargo, crew, and passengers), including shared service contractor-owned vehicles, located on the company premises – except as noted in the out of scope section below.
- Transport operations (equipment, cargo, crew, and passengers) involving company-owned vehicles, watercraft and aircraft, both on and off company premises (including deliveries to customers).
- Transport operations (equipment, cargo, crew, and passengers) involving company-dedicated, contractor-owned vehicles, watercraft and aircraft, when:
  - on company premises
  - travelling directly between company premises
  - travelling while performing work on behalf of the company

## Out of scope

### *Third parties and equipment*

- Mail, courier, service, and incidental delivery services on company premises that are not contractually dedicated for exclusive use by company and who move on and off company premises, engaging with other organizations as a normal activity (e.g., office supply, vending machine deliveries).
- Municipal services (e.g., utility connections, waste pickup) personnel on company premises performing their normal activities. This exception does not apply to collection or handling of process waste or other services directly related to operations.
- Contract employees who are performing work on the contractor's premises – including fabrication yards, design offices and maintenance shops, according to Mode 3 as defined in IOGP Report 423 - [\*HSE Management – Guidelines for working together in a contract environment\*](#).
- Casual visitors and guests on company premises (e.g., customers, suppliers, public officials, tour groups) that are escorted by company employees or contract employees.
- Visitors and business partners on premises engaged in emergency response activities related to a non-company event (for example natural disaster such as earthquake/hurricane).
- Drilling and workover rigs, well service equipment, or marine vessels on company premises that are non-operating and either:
  - are on standby, waiting to commence work for the company
  - have finished work for the company and are on standby, waiting to mobilise to another distinct location or to be taken off of company premises

This item only applies if there is an explicit understanding that the provider is not under contract to the company at the time, and the company is allowing the standby storage to take place on premises for the sole convenience and benefit of the contractor. It does not apply to operations at contractor shops, offices and other facilities on company premises.

### *Business entities*

- Business entities who have been authorized by the company to use a discrete, isolated work area on company premises that is solely under the control of the business entity (including the application of its own management system) and is for the benefit of one or more third parties, (e.g., a gas plant at a refinery, a power generation plant in a production field or a custody transfer station).

# APPENDIX 1: Medical treatment cases (MTC)

## Medical treatment cases (MTC)

An incident is classified as a MTC when the management and care of the patient to address the injury is above and beyond First Aid (see 15 First Aid treatments listed below)

MTC do not include:

- The conduct of diagnostic procedures, such as x-rays and blood tests, including the administration of prescription medications used solely for diagnostic purposes (e.g., eye drops to dilate pupils).
- Visits to a physician or other licensed health care professional (including hospital) solely for observation or counselling.

The following may not involve any treatment, but for purposes of severity classification, are reported as MTC:

- Any loss of consciousness.
- Significant injury diagnosed by a physician or other licensed health care professional for which no treatment is given or recommended at the time of diagnosis. Examples include punctured ear drums, broken teeth, fractured ribs or toes, byssinosis and some types of occupational cancer.
- Needle stick injuries and cuts from sharp objects that are contaminated with another person's blood or other potentially infectious material.
- Occupational hearing loss (acute exposure is considered an injury whereas chronic exposure is considered an occupational illness and outside of IOGP's scope of reporting).
- Medical removal under a government standard.

Note: First aid carries a very specific meaning. Please refer to the definition of first aid.

## First aid

An incident is classified as a first aid if the treatment of the resultant injury is limited to one or more of the 15 specific treatments. These are:

- using a non-prescription medication at non-prescription strength
- administering tetanus immunizations
- cleaning, flushing or soaking wounds on the surface of the skin
- using wound coverings such as bandages, adhesive plasters, gauze pads, etc.; or using butterfly bandages
- using hot or cold therapy
- using any non-rigid means of support, such as elastic bandages, wraps, non-rigid back belts, etc.
- using temporary immobilization devices while transporting an accident victim (e.g., splints, slings, neck collars, back boards, etc.)
- drilling of a fingernail or toenail to relieve pressure, or draining fluid from a blister

- using eye patches
- removing foreign bodies from the eye using only irrigation or a cotton swab
- removing splinters or foreign material from areas other than the eye by irrigation, tweezers, cotton swabs or other simple means
- using finger guards
- using massage
- drinking fluids for relief of heat stress
- using adrenaline auto-injectors if pre-prescribed for the patient

### Prescription medication

When making the classification, it should be remembered that the intent is to distinguish those more severe situations that require a medical practitioner to use strong antibiotics and painkillers from those that only require first aid.

For medications available in both prescription and non-prescription form, a recommendation by a physician or other licensed health care professional to use a non-prescription medication at prescription strength is considered medical treatment. The definition of prescription medication may be used to determine when the prescription strength threshold has been crossed.

**Where local regulations specify prescription medication and dosage these will be followed for the purposes of IOGP reporting.** Where 'prescription medication' is not defined by the local regulatory system the reporting company is responsible for defining prescription medicines and dose rates the following is provided as guidance:

These criteria are provided in order to list those medications that, when prescribed or provided for occupational injuries, uniformly result in recordable incidents, for the purposes of corporate occupational injury reporting. They are to be used in conjunction with other corporate occupational injury recording guidelines addressing diagnosis and level of treatment provided/required, as a means of achieving greater standardization of reporting across global operations.

For purposes of corporate reporting, prescription medication means:

- All antibiotics, including those dispensed as prophylaxis where injury has occurred to the subject individual.

**Exceptions:** Dermal applications of bacitracin, neosporin, polysporin, polymyxin, iodine, or similar preparation.

- Diphenhydramine greater than 50 milligrams (mg) in a single application or any dose "injected".
- All analgesic and nonsteroidal anti-inflammatory medication (NSAID) including:
  - Ibuprofen – Greater than 467 mg in a single dose.
  - Naproxen Sodium – Greater than 220 mg in a single dose.
  - Ketoprofen – Greater than 25 mg in a single dose.
  - Codeine analgesics – Greater than 16 mg in a single dose.

Note: Shortening the dosing interval to less than the label instructions for over the counter medications should be reviewed. If it produces a total dose of the above listed or labelled allowed OTC amount it is considered reportable.

**Exceptions:** Acetylsalicylic acid (Aspirin), acetaminophen (paracetamol) and dermal applications of NSAIDs not obtained by prescription are not considered medical treatment.

- All dermally applied steroid applications.

**Exceptions:** Hydrocortisone preparations in strengths of 1 percent or less.

- All vaccinations used for treatment of work-related exposure.

**Exceptions:** Tetanus.

- All narcotic analgesics (except codeine as listed above).
- All bronchodilators.

**Exceptions:** Epinephrine aerosol 5.5 mg/ml or less.

- All muscle relaxants (e.g., benzodiazepines, methocarbamol, and cyclobenzaprine).
- All injections are reportable unless specified above.
- All other medications (not listed above) that legally require a prescription for purchase or use in the state or country where the injury occurred.

**Exceptions:** Medication used for the sole purpose of diagnosis (e.g., dilating or numbing an eye for exam purposes only) is not considered medical treatment.

For areas that are not clear, please seek advice from a company physician or medical consultant and document your reasoning for classification.

## APPENDIX 2: Glossary of general terms

### Assault and violent act (as an incident/event category)

Intentional attempt, threat, or act of bodily injury by a person or person(s) or by violent harmful actions of unknown intent, includes intentional acts of damage to property.

### Aviation accident (as an incident/event category)

An occurrence associated with the operation of an aircraft which, in the case of a manned aircraft, takes place between the time any person boards the aircraft with the intention of flight until such time as all such persons have disembarked or, in the case of an unmanned aircraft, takes place between the time the aircraft is ready to move with the purpose of flight until such time as it comes to rest at the end of the flight and the primary propulsion system is shut down, in which a person is fatally or seriously injured as a result of:

1. being in the aircraft
2. direct contact with any part of the aircraft, including parts which have become detached from the aircraft
3. direct exposure to jet blast or rotor downwash, **except** when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew

### Barrier

A risk control that seeks to prevent unintended events from occurring or prevent escalation of events into incidents with harmful consequences.

### Barrier/safety system challenge (in the context of well control incidents)

A barrier is exposed to conditions beyond design limits but does not fail. Design limits include pressure, volume, temperature, H<sub>2</sub>S, access to materials or equipment, personal and team competency, access to procedures, access to expertise, loss of utilities or auxiliary equipment, operating issues (lost circulation, stuck pipe, plugged flow path, hydrates).

### Barrier/safety system failure (in the context of well control incidents)

A barrier fails to function as designed.

### Caught in, under or between (as an incident/event category)

Injury where injured person is crushed or similarly injured between machinery moving parts or other objects, caught between rolling tubulars or objects being moved, crushed between a ship and a dock, or similar incidents. Also includes vehicle incidents involving a rollover.

### Company employee

Any person employed by and on the payroll of the reporting company, including corporate and management personnel specifically involved in exploration and production. Persons employed under short-service contracts are included as company employees provided they are paid directly by the company.

### Confined space (as an incident/event category)

Spaces that are considered “confined” because their configurations hinder the activities of employee who must enter, work in, and exit them. Confined spaces include, but are not limited to underground vaults, tanks, storage bins, manholes, pits, silos, process vessels, and pipelines.

### Construction (as a work function)

Major construction, fabrication activities and also disassembly, removal, and disposal decommissioning, at the end of the facility life. Includes construction of process plant, yard construction of structures, offshore installation, hook-up and commissioning, and removal of redundant process facilities.

### Construction, commissioning, decommissioning (as a type of activity)

Activities involving the construction, fabrication and installation of equipment, facilities or plant, testing activities to verify design objectives or specification, and also disassembly, removal and disposal (decommissioning) at the end of the facility life.

### Contractor

An individual or organization performing work for the reporting company, following verbal or written agreement. ‘Subcontractor’ is synonymous with ‘contractor’ (see IOGP Report 510).

### Contractor employee

Any person employed by a contractor or contractor’s subcontractor(s) who is directly involved in execution of prescribed work under a contract with the reporting company.

### Cut, puncture, scrape (as an incident/event category)

Abrasions, scratches, and wounds that penetrate the skin.

### Diving operations

The personnel, equipment, and management systems to support a person who dives. A person ‘Dives’ if he enters water or any other liquid, or a chamber in which he is subject to pressure greater than 100 millibars above atmospheric pressure: and in order to survive in such an environment he breathes air or other gas at a pressure greater than atmospheric pressure. Or for such a purpose uses a vehicle, capsule, or suit where a sealed internal atmospheric pressure is maintained and where the external pressure differential is greater than 100 millibars.

### Diving (including decompression), subsea, ROV (as a type of activity)

Operations involving diving and any associated decompression activities (see definition for diving operations), subsea equipment or activities and/or operations involving underwater remotely operated vehicles (ROV).

### Drilling (as a work function)

All exploration, appraisal, and production drilling and workover as well as their administrative, engineering, construction, materials supply and transportation aspects. It includes site preparation, rigging up and down and restoration of the drilling site upon work completion. Drilling includes ALL exploration, appraisal, and production drilling.

#### Driver [From IOGP Report 365]

An individual who operates a motor vehicle.

#### Drilling/workover/well operations (as a type of activity)

Activities involving the development, maintenance work or remedial treatments related to an oil or gas well. Well operations (Reference IOGP Report 456 3rd edition) include all activities related to well construction (e.g., exploration, appraisal and development drilling and completions), well testing, surveillance, interventions, and workovers (e.g., wireline, stimulation, coiled tubing), and abandonment (including downhole plugging and temporary abandonment).

#### Dropped objects (as an incident/event category)

Any item with the potential to cause injury, death, or equipment/environmental damage, that falls down or over from its previous position. Specifically excludes falls from height (people).

Source: [Dropped Object Prevention Scheme, Recommended Practice](#)

#### Event

An unplanned or uncontrolled outcome of a business operation or activity that has or could have contributed to an injury or physical damage or environmental damage.

#### Excavation, trenching, ground disturbance (as a type of activity)

Work that involves a cut, cavity, trench or depression in the earth's surface formed by earth removal.

#### Exploration (as a work function)

Geophysical, seismographic, and geological operations, including their administrative and engineering aspects, construction, maintenance, materials supply, and transportation of personnel and equipment; excludes drilling.

#### Explosion [From API RP 754]

A release of energy that causes a pressure discontinuity or blast wave (e.g., detonations, deflagrations, and rapid releases of high pressure caused by rupture of equipment or piping).

#### Explosion, Fire or Burn (as an incident/event category)

Burns or other effects of fires, explosions and extremes of temperature. 'Explosion' means a rapid combustion, not an overpressure.

#### Exposure: Electrical (as an incident/event category)

Exposure to electrical shock or electrical burns etc.

#### Exposure: Noise, chemical, biological, vibration, radiation (as an incident/event category)

Exposure to noise, chemical substances (including asphyxiation due to lack of oxygen not associated with a confined space), hazardous biological material (including animal attacks/bites, insect stings, effects of poisonous plants etc.), vibration or radiation.

### Falls from height (as an incident/event category)

A person falls from one level to another.

### Fatal Accident Rate (FAR)

The number of fatalities per 100,000,000 (100 million) work hours.

### Fatal Incident Rate (FIR)

The number of fatal incidents per 100,000,000 (100 million) work hours.

### Fatal and Permanent Impairment Rate (FPIR)

The number of fatalities and permanent impairment injuries per 100,000,000 (100 million) work hours.

### Fire [From API RP 754]

Any combustion resulting from an LOPC, regardless of the presence of flame. This includes smouldering, charring, smoking, singeing, scorching, carbonizing, or the evidence that any of these have occurred.

### First aid case

Cases that are not sufficiently serious to be reported as medical treatment or more serious cases but nevertheless require minor first aid treatment, e.g., dressing on a minor cut, removal of a splinter from a finger. First aid cases are not recordable incidents. See Appendix 1.

### High potential event

An event which could have, under slightly different circumstances, realistically resulted in a fatal incident.

### Hours worked

For onshore operations the actual 'hours worked', including overtime hours, are recorded. The hours worked by an individual will generally be about 2000 per year.

For offshore workers, the 'hours worked' are calculated on a 12-hour work day. Consequently average hours worked per year will vary from 1600 to 2300 hours per person depending upon the on/off shift ratio. Vacations and leaves are excluded.

### Hospital admission [From API RP 754]

Formal acceptance by a hospital or other inpatient health care facility of a patient who is to be provided with room, board, and medical service in an area of the hospital or facility where patients generally reside at least overnight. Treatment in the hospital emergency room or an overnight stay in the emergency room would not by itself qualify as a 'hospital admission'.

### Incident

An unplanned or uncontrolled event or chain of events that has resulted in at least one fatality, recordable injury, or physical or environmental damage.

### Key performance indicator (KPI)

Information or data that provides evidence of a company's performance in managing its key risks.

KPIs may also be referred to as performance metrics.

### Lifting, crane, rigging, deck operations (as a type of activity)

Activities related to the use of mechanical lifting and hoisting equipment, assembling, and disassembling drilling rig equipment and drill pipe handling on the rig floor.

### Lost time injury (LTI)

A fatality or lost work day case. The number of LTIs is the sum of fatalities and lost work day cases.

### Lost time injury rate (LTIR)

The number of lost time injuries (fatalities + lost work day cases) per 1,000,000 (1 million) work hours.

### Lost work day case (LWDC)

Any work-related injury, other than a fatal injury, which results in a person being unfit for work on any day after the day of occurrence of the occupational injury. "Any day" includes rest days, weekend days, leave days, public holidays or days after ceasing employment.

### Loss of primary containment (LOPC)

An unplanned or uncontrolled release of any material from primary containment, including non-toxic and non-flammable materials (e.g., steam, hot water, nitrogen, compressed CO<sub>2</sub> or compressed air). [From API RP 754]

For drilling operations, any unplanned or uncontrolled release to the surface (seabed or ground level) should be included. LOPC is a type of event. An unplanned or uncontrolled release is an LOPC irrespective of whether the material is released into the environment, or into secondary containment, or into other primary containment not intended to contain the material released under normal operating conditions).

### Maintenance, inspection, and testing (as a type of activity)

Activities related to preserving, repairing, examining, and function testing assets, equipment, plant, or facilities.

### Material release threshold quantity

The weight of gas, liquid, or solid material released from an LOPC which, if exceeded, results in the event being recordable as either a Tier 1 or 2 PSE. The threshold quantities are described more fully in API RP 754 and follow the UNDG classification system.

### Medical cause of death

This is the cause of death given on the death certificate. Where two types of causes are provided, such as "pulmonary oedema" caused by "inhalation of hot gases from a fire", both are recorded.

### Medical treatment case (MTC)

Cases that are not severe enough to be reported as lost work day cases or restricted work day cases but are more severe than requiring simple first aid treatment. Note: A MTC reported under the OSHA reporting requirements should also be reported to IOGP. See Appendix 1 for further information.

### Motor vehicle [From IOGP Report 365]

Any mechanically powered vehicle used to transport people or property, including any load on or attached to the vehicle (e.g., a trailer). This includes motorcycles. Specifically excluded from the definition of motor vehicle are vehicles operated on fixed rails and onsite vehicles that are not capable of more than 10 mph (16 kph). Vehicles are split into four sub-categories:

- heavy vehicle (HV)
- light vehicle (LV)
- mobile equipment
- motorcycles

Note: for the purposes of this Report, all types of pickup truck (including those exceeding a gross vehicle weight of 3.5 tonnes) are to be considered as a light vehicle and all types of cargo trucks (including those with a gross vehicle weight less than 3.5 tonnes) are to be considered as a heavy vehicle.

Refer to IOGP Report 365 – [Land transportation safety practice](#).

### Motor vehicle crash (MVC) [From IOGP Report 365]

A work-related motor vehicle incident (collision or other event), which resulted in vehicle damage, or vehicle rollover, or personal injury, or fatality.

Note: Contractor motor vehicle crash includes any vehicle operated by a contractor or subcontractor while performing work on behalf of the company, where injuries, kilometres driven, or hours worked should be recorded (e.g., delivery/courier services are excluded).

Refer to IOGP Report 365 – [Land transportation safety practice](#).

### MVC work-relatedness [From IOGP Report 365]

Any crash involving a vehicle while performing company business.

Note: Work-relationship is presumed for crashes resulting from business being conducted on behalf of the company while operating a company assigned vehicle. Examples of company business include driving a client to the airport, driving to the airport for a business trip, taking a client or work colleague out for a meal, deliveries, visiting clients or customers, or driving to a business-related appointment. Personal business which should not be counted includes, but is not limited to, personal shopping, getting a meal by yourself, commuting to and from home, or driving to a private medical appointment.

Also see <https://data.iogp.org/Vehicle/MvcExamples> for worked examples.

### Near Miss

An unplanned or uncontrolled event or chain of events that has not resulted in recordable injury or physical damage or environmental damage but had the potential to do so in other circumstances.

### Number of employees

Average number of full-time and part-time employees involved in exploration and production, calculated on a full-time basis, during the reporting year.

### Number of lost work days

The sum total of calendar days (consecutive or otherwise) after the days on which the occupational injuries occurred, where the persons involved were unfit for work and did not work.

### Number of fatalities

The total number of company's employees and/or contractor's employees who died as a result of an incident. 'Delayed' deaths that occur after the incident are to be included if the deaths were a direct result of the incident. For example, if a fire killed one person outright, and a second died three weeks later from lung damage caused by the fire, both are reported. In some cases, a delayed fatality occurs in the next calendar year after the incident. For example, if the above fire occurred on December 21, 2019, the second death from it might occur in January 2020. All fatalities from an incident are included in the report for the year of that incident. In the above case, the fatality in 2020 is reported with the 2019 data.

### Number of permanent impairments

The total number of permanent impairment injuries as defined at <https://iogp.org/fpi>.

### Occupational illness

Any abnormal condition or disorder, or any fatality other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. Occupational illness may be caused by inhalation, absorption, ingestion of, or direct contact with the hazard, as well as exposure to physical and psychological hazards. It will generally result from prolonged or repeated exposure.

Note: Lagging occupational illness data is not currently requested by IOGP.

Refer to IOGP-IPIECA Report 393 – [Health Performance Indicators](#).

### Occupational injury

Any injury such as a cut, fracture, sprain, amputation, etc., or any fatality, which results from a work-related activity or from an exposure involving a single incident in the work environment, such as deafness from explosion, one-time chemical exposure, back disorder from a slip/trip, insect or snake bite.

### Off-road [From IOGP Report 365]

A route used for access to places which are not accessible by a road, (see 'Road').

#### Office, warehouse, accommodation, catering (as a type of activity)

Activities related to work conducted in offices, warehouses, workshops, accommodation and catering facilities.

#### Officially declared [From API RP 754]

A declaration by a recognized community official (e.g., fire, police, civil defence, emergency management) or delegate (e.g., company official) authorized to order the community action (e.g., shelter-in-place, evacuation).

#### Officially declared community evacuation or community shelter-in-place

See precautionary (evacuation, public protective measure, shelter-in-place).

#### Offshore work

All activities and operations that take place at sea, including activities in bays, in major inland seas, such as the Caspian Sea, or in other inland seas directly connected to oceans. Events (including incidents) including transportation of people and equipment from shore to the offshore location, either by vessel or helicopter, should be recorded as “offshore”.

#### Onshore work

All activities and operations that take place within a landmass, including those on swamps, rivers and lakes. Land-to-land aircraft operations are counted as onshore, even though flights are over water.

#### Other (as an incident/event category)

Used to specify where an incident cannot be logically classed under any other category. In the case of incident activities, includes air transport incidents.

#### Overexertion or strain (as an incident/event category)

Physical overexertion, e.g., muscle strain.

#### Permanent disfigurement

See FAQ #22 at <https://iogp.org/fpi>.

#### Permanent impairment

Permanent impairment is defined as the outcome of a work-related injury from which the worker cannot or is not expected to return to their previous (pre-incident) whole person function as a result of an acute, single incident, resulting in any of the following:

- permanent loss of body parts
- permanent reduction of organ’s physiological function
- permanent reduction in skin and musculoskeletal function
- permanent reduction in psychological, social, or cognitive function

For reporting purposes, the classification is to be made within 180 days of the injury.

“Whole person function” relates to a person’s physiological/psychological status. Impairment is defined as either, or both:

- loss of ability to return to the previous work role
- loss of ability to perform the activities of daily living (ADL)

See full reporting guidance at <https://iogp.org/fpi>.

#### Planned shutdown (as a PSE mode of operation)

A planned shutdown is the activity of shutting down a process unit normally for planned maintenance or a turnaround.

#### Precautionary (evacuation, public protective measure, shelter-in-place) [From API RP 754]

A measure taken from an abundance of caution.

For example, a company may require all workers to shelter-in-place in response to an LOPC independent of or prior to any assessment (e.g., wind direction, distance from the LOPC, etc.) of the potential hazard to the workers.

For example, a recognized community official (e.g., fire, police, civil defence, emergency management) may order a community shelter-in-place, evacuation, or public protective measure (e.g., road closure) in the absence of information from a company experiencing a process safety event, or ‘just in case’ the wind direction changes, or due to the sensitive nature of the potentially affected population (e.g., school children, the elderly).

#### Pressure release (as an incident/event category)

Release of gas, liquid, or object under pressure from a pressurized system.

#### Pressure relief device (PRD) [From API RP 754]

A device designed to open and relieve excess pressure (e.g., safety valve, thermal relief, rupture disk, rupture pin, deflagration vent, pressure/vacuum vents).

Note: A PRD discharge is a LOPC due to the nature of the unplanned release. The PRD discharge is evaluated against the consequence criteria to determine if it is a Tier 1 or 2 PSE.

#### Primary containment [From IOGP Report 456]

A tank, vessel, pipe, truck, rail car, or other equipment designed to keep a material within it, typically for purposes of storage, separation, processing or transfer of gases or liquids.

#### Process

Facilities used in drilling and production operations in the oil and gas industry. This includes rigs and process equipment (e.g., vessels, piping, valves, boilers, generators, pumps, compressors, exchangers, refrigeration systems) and includes storage tanks, ancillary support areas (e.g., boiler houses and waste water treatment plants), on-site remediation facilities, and distribution piping under control of the company.

### Process safety [From API RP 754]

A disciplined framework for managing the integrity of hazardous operating systems and processes by applying good design principles, engineering, and operating and maintenance practices. It deals with the prevention and control of events with the potential to release hazardous materials or energy. Such releases can result in toxic effects, fire, or explosion, and could ultimately result in serious injuries, property damage, lost production and environmental impact.

Refer to IOGP Report 456 – [\*Process safety – recommended practice on key performance indicators\*](#).

### Process safety event (PSE) [From API RP 754]

An unplanned or uncontrolled release of any material including non-toxic and non-flammable materials (e.g., steam, hot water, nitrogen, compressed CO<sub>2</sub> or compressed air) from a process, or an undesired event or condition, that under slightly different circumstances, could have resulted in a release of material.

Refer to IOGP Report 456 – [\*Process safety – recommended practice on key performance indicators\*](#).

### Process safety event rate (PSER, PSE Rate)

The number of process safety events per 1,000,000 (1 million) work hours (production and drilling work hours only).

### Production (as a work function)

Petroleum and natural gas producing operations, including their administrative and engineering aspects, minor construction, repairs, maintenance and servicing, materials supply, and transportation of personnel and equipment. It covers all mainstream production operations including wireline. Gas processing activities with the primary intent of producing gas liquids for sale including;

- secondary liquid separation (i.e., natural gas liquids [NGL] extraction using refrigeration processing)
- liquefied natural gas (LNG) and gas to liquids (GTL) operations

See Section 3.1 for more detail of exclusions.

### Production operations (as a type of activity)

Activities related to the extraction of hydrocarbons from source such as an oil or gas well or hydrocarbon bearing geological structure, including primary processing, storage and transport operations. Includes normal, start-up, or shut-down operations.

### Rainout [from API RP 754]

Two-phase relief (vapour and entrained liquid) from a vent or relief device with the vapor phase dispersing to the atmosphere and the remaining liquid falling to grade or ground.

### Recordable injury

A type of event or incident, including an LOPC or an occupational injury, or other outcome which has been determined to meet or exceed definitions, criteria or thresholds for inclusion and classification in data provided to IOGP. For IOGP, recordable injuries include fatalities, lost work day cases, restricted work day cases, and medical treatment cases. The broader term 'reportable' is often used to indicate the wider range of KPI data collected within the company for local or corporate use, of which only part will also be recordable.

### Restricted work day case (RWDC)

Any work-related injury other than a fatality or lost work day case which results in a person being unfit for full performance of the regular job on any day after the occupational injury. Work performed might be:

- an assignment to a temporary job
- part-time work at the regular job
- working full-time in the regular job but not performing all the usual duties of the job

Where no meaningful restricted work is being performed, the incident should be recorded as a lost work day case (LWDC). This is a recordable incident.

### Road (on-road) [from IOGP Report 365]

A thoroughfare which has a prepared, graded and levelled surface designed for the conveyance of motor vehicles (see also 'off-road'), i.e.,:

- asphalt, tarmac
- concrete
- aggregate
- dirt/sand
- ice

### Sabotage

Deliberately destroy, damage, or obstruct (something).

### Secondary containment [From API RP 754]

An impermeable physical barrier specifically designed to mitigate the impact of materials that have breached primary containment (i.e., an LOPC). Secondary containment systems include, but are not limited to tank dikes, curbing around process equipment, open drainage collection systems, trenches, pits, open sumps, the outer wall of open top double-walled tanks, etc.

### Seismic/survey operations (as a type of activity)

Activities relating to the determination of sub-surface structures for the purpose of locating oil and gas deposits including geophysical and seismic data acquisition.

### Shelter-in-place [From API RP 754]

The use of a structure or portion of a structure and its indoor atmosphere to temporarily separate individuals from a potentially hazardous outdoor atmosphere.

### Slips and trips (at the same height) (as an incident/event category)

Slips, trips and falls caused by falling over or onto something at the same height.

### Struck by (as an incident/event category)

Incidents/events where injury results from being hit by moving equipment and machinery, or by flying or falling objects. Also includes vehicle incidents where the vehicle is struck by or struck against another object.

### Third party [From API RP 754]

Any individual other than an employee, contractor or subcontractor of the Company, e.g., visitors, non-contracted delivery drivers, residents.

### Tier

One of the four levels of the IOGP framework for process safety KPIs as described in this Report, which is in turn based on API RP 754.

### Total recordable injuries (TRI)

The sum of fatalities, lost work day cases, restricted work day cases and medical treatment cases.

### Total recordable injury rate (TRIR)

The number of recordable injuries (fatalities + lost work day cases + restricted work day cases + medical treatment cases) per million hours worked.

### Transport – air (as a type of activity)

Involving aircraft, either fixed wing or helicopters. Injuries caused by accidents on the ground at airports are classified in one of the other categories.

### Transport – land (as a type of activity)

Involving motorised vehicles designed for transporting people and goods over land, e.g., cars, buses, trucks. Pedestrians struck by a vehicle are classified as land transport incidents. Incidents from a mobile crane would only be land transport incidents if the crane were being moved between locations.

### Transport – water, including marine activity (as a type of activity)

Involving vessels, equipment or boats designed for transporting people and goods over water (including inland, marine, ice roads and marsh/swamp), such as supply vessels or crew boats.

### Turnaround (as a PSE mode of operation)

A planned, periodic shut down (total or partial) of a process unit or plant to perform maintenance, overhaul and repair operations and to inspect, test and replace process materials and equipment. This is after a planned shutdown.

### United nations dangerous goods (UNDG) [From API RP 754]

A classification system used to evaluate the potential hazards of various materials when released, which is used by most international countries as part of the product labelling or shipping information. See glossary of IOGP Report 456.

### Unsafe location [From API RP 754]

An atmospheric pressure relief device discharge point or downstream destructive device (e.g., flare, scrubber) discharge point that results in a potential hazard to personnel due to their proximity, such as the formation of flammable mixtures at ground level or on elevated work structures, presence of toxic or corrosive materials at ground or on elevated work structures, or thermal radiation effects from ignition of relief streams at the point of emission.

### Unspecified – other (as a type of activity)

Incidents that cannot be logically classed under other headings or where the activity is unknown.

### Water related/drowning (as an incident/event category)

Incidents/events in which water played a significant role including drowning.

### Well barrier element

A physical element (including a fluid column), in combination with other well barrier elements, forms a well barrier envelope to prevent flow.

### Well barrier envelope

One or several verified well barrier elements that collectively prevents unintentional flow from a source. Often abbreviated to well barrier, e.g., primary or secondary well barrier.

### Well site

The areas that are directly disturbed during the drilling and subsequent operation of, or affected by production facilities directly associated with, any oil well, gas well, or injection well and its associated well pad.

Source: IADC Lexicon

### Wilful damage

Wilful or malicious damage or destruction of the property of another.

### Work-related injury

See occupational injury.

## APPENDIX 3: Glossary of causal factors

This glossary is provided to assist the user of the IOGP list of causal factors, to further define and explain the classifications. Since the causal factors selected will be used for trend analysis, accuracy in selecting the appropriate cause is important. Users are encouraged to use this glossary to ensure proper understanding of each cause category.

### **FOLLOWING PROCEDURES**

**Deviation intentional (by individual or group):** deliberate deviations from rules, procedures, regulations etc. An individual or a group of people fully aware that they were taking a risk i.e., knowingly take short cuts, or failing to follow procedures, to save time or effort. Usually well-meaning but misguided in an attempt to “get the job done”, e.g., operating equipment that individuals know they are not authorized for.

**Deviation unintentional (by individual or group):** an individual or a group of people not aware that they were taking a risk, did not identify the hazard or were unaware of HSE requirements. The persons involved did not have sufficient awareness, training or competence to perform the tasks required in accordance with procedures, procedures were inadequate or were not properly implemented, no procedures available for the task.

**Improper position (in the line of fire):** person(s) were located in a position where they were exposed to a hazard, e.g., between a moving and a fixed object, in the line of a moving counterweight, standing under a suspended load, positioned under or behind a vehicle, in the path of a material release from an energized system etc.

**Overexertion or improper position/posture for task:** the person did more than they were physically able to do or did not follow the proper ergonomic practices. e.g., carrying too much weight, or placing body parts in unsafe positions which resulted in physical strain.

**Work or motion at improper speed:** the person involved was not working at the proper speed, not taking time to do things safely, e.g., driving too fast, running down stairs, or adding chemicals too fast or too slowly, etc.

**Improper lifting or loading:** material being lifted, either by human or mechanical means, was not lifted or loaded/unloaded in accordance with proper practices or was over the capacity of the person or the lifting equipment. e.g., a vehicle or equipment loaded to one side or overloaded.

### **USE OF TOOLS, EQUIPMENT, MATERIALS AND PRODUCTS**

**Improper use/position of tools/equipment/materials/products:** tools/equipment/materials or products were used for activities for which they were not designed or were misused, e.g., wrong tool for the job, using excessive force on a tool (such as the use of cheater bars), operating equipment beyond the maximum recommended temperature, operating speed or pressure. Knowing that the tools or equipment were defective and continuing the work, e.g., running a forklift with leaking hydraulics. Using a product which was known to be out of specification or wrong for the application. Materials placed in potentially hazardous position e.g., equipment too heavy for surface it was placed on, restricted access to essential controls, products placed in location where likely to be damaged etc.

**Servicing of energized equipment/inadequate energy isolation:** servicing equipment without turning it off or without it being electrically or mechanically safeguarded according to energy isolation and equipment opening procedures, e.g., lockout tag out, trying to clear a jammed machine, cleaning out a plugged line, etc.

## **USE OF PROTECTIVE METHODS**

**Failure to warn of hazard:** the person involved in the event was not warned about a dangerous condition or activity, or an individual was aware of a hazard but did not warn current or future persons involved of the exposure, e.g., not using “out of service” tags on a defective tool, inadequate signage, no barriers placed around an open hole.

**Inadequate use of safety systems:** safety systems were not adequately used e.g., any permit to work not properly used, confined space entry requirements were not followed e.g., no gas testing performed, equipment was not properly isolated, and the people involved were exposed to chemicals, hot surfaces, pressure, electricity, etc.

**Personal protective equipment not used or used improperly:** equipment prescribed in the procedures was not used, was not available or the required personal protective equipment was used, but it was not used in the proper way, e.g., no safety harness worn when required for working at height, poorly fitted respiratory protection, incorrect type of respirator or safety glasses worn when safety goggles were prescribed.

**Equipment, or materials not secured:** equipment or materials was not secured against movement or falling, e.g., ladder not secured, materials not stacked properly, insecure scaffolding, working at height with unsecured tools e.g., not tied off.

**Disabled or removed guards, warning systems or safety devices:** the proper guards, warning systems or other safety devices were either in place but were disabled or overridden to allow the work to proceed without these protections or had been removed at some prior time, and not reinstalled or reactivated.

## **INATTENTION/LACK OF AWARENESS**

**Improper decision making or lack of judgement:** the situation was wrongly judged, and the wrong decision was made or person(s) involved in the event were engaged in inappropriate activities, including practical jokes.

**Lack of attention/distracted by other concerns/stress:** the person involved was performing a routine activity, such as walking, sitting down, stepping, etc. without conscious thought or was distracted and not attentive to the work in progress. The person was under high stress from either work/personal issues or conflicting directions/demands contributed to an incident or the work being done required judgement and decision making that created stress, e.g., time sensitive decisions, high stakes in the outcome, incomplete information in which to base the decision.

**Acts of violence:** any type of physical or mental confrontations that can cause bodily injury or mental distress.

**Use of drugs or alcohol:** person(s) involved in the event may have been or were found to be under the influence of drugs or alcohol (illegal or legal which affect performance).

**Fatigue:** person(s) involved were mentally tired for whatever reason e.g., excessive work hours, shift patterns, staffing levels insufficient, ill-health etc. The loss of situational awareness, task fixation, distraction, and mental fatigue due to sleep loss are examples of conditions that apply to this causal factor.

## **PROCESS (CONDITIONS) CLASSIFICATIONS**

Process (Conditions) classifications usually involve some type of physical hazard or organizational aspect out with the control of the individual. There are five major classification categories, with an additional level of detail under each of the major categories.

### **PROTECTIVE SYSTEMS:**

**Inadequate/defective guards or protective barriers:** adequate guards and protective barriers that were needed to protect the worker were not present or did not provide sufficient protection or failed at the time of the incident.

**Inadequate/defective personal protective equipment:** the personal protective equipment used was not adequate for the situation at the time of the incident, the wrong type of PPE was specified, the PPE was defective at the time of the incident or PPE was not properly maintained or inspected.

**Inadequate/defective safety devices/warning systems:** safety devices such as pressure relief valves or over-speed trip devices were present but did not act quickly enough to prevent the incident or failed to activate at the time of the event. No safety device(s) in place when it should have been. Inadequate warning systems were present or adequate warning systems failed to provide notice at the time of the incident or no warning system in place when it should have been.

**Inadequate security provisions or systems:** security systems were present such as perimeter fencing, alarm systems, security guards, security contracted services etc. but did not function as intended to protect facilities and personnel as appropriate. Also, no security provisions or systems in place when they should have been.

### **TOOLS, EQUIPMENT, MATERIALS & PRODUCTS:**

**Inadequate design/specification/management of change:** the design or engineering of the plant/equipment did not adequately take into account HSE issues, or the management of change processes were inadequate or not applied effectively. This could be applicable either to changes to the plant/equipment or to changes in procedures.

**Inadequate/defective tools/equipment/materials/products:** the tools/ equipment/ materials/ products needed to do the job were in some way inadequate, not supplied, were defective or were not prepared adequately prior to the job, e.g., tools in poor condition or not cleaned of contaminants, a vessel not thoroughly cleaned of chemicals prior to entry, a pallet of chemicals not adequately packaged, lifting equipment not suitably rated for a lift.

**Inadequate maintenance/inspection/testing:** facilities, infrastructure or equipment was not subject to adequate maintenance, inspection and/or testing not performed as required to ensure asset integrity.

### WORK PLACE HAZARDS:

**Congestion, clutter, or restricted motion:** design of the workplace was poor and not enough clearances were available or accessibility was inadequate. Housekeeping was inadequate, or work location was not clean and orderly.

**Inadequate surfaces, floors, walkways, or roads:** the incident was caused by an inadequate surface, floor or walkway, e.g., slippery stairs, uneven concrete or paving, ungraded road with potholes, etc.

**Hazardous atmosphere (explosive/toxic/asphyxiant):** the workplace was contaminated with flammable or explosive materials in concentrations which on contact with a source of ignition may cause a fire or explosion or concentrations of toxic chemicals above workplace exposure limits or oxygen levels below safe breathing limits.

**Storms or acts of nature:** the incident was a direct or indirect result of a storm, tornado, hurricane, lightening, hail storm, flood, earthquake, etc.

### ORGANIZATIONAL:

**Inadequate training/competence:** the organization did not provide adequate training and/or did not take appropriate measures to ensure the competence of person(s) performing tasks.

**Inadequate work standards/procedures:** the systems of work, processes or procedures provided by the organization were not adequate to effectively control the risks involved in the task, i.e., procedures may have been in place and implemented but the requirements stated were insufficient, e.g., confined space entry permit system which does not specify a requirement to gas test prior to entry.

**Inadequate hazard identification or risk assessment:** the person(s) involved in the work either did not recognize the hazard present or did not fully understand the risks involved, e.g., the pre-job checks or tool box talks did not cover appropriate issues.

**Inadequate communication:** the communication of the requirements of the task and the controls required were inadequate to effectively control the risks and/or inform the involved person(s).

**Inadequate supervision:** the organization did not provide adequate supervision for person(s) performing tasks.

**Poor leadership/organizational culture:** the organization did not reinforce the correct behaviours, participation in safety efforts were not effective, and/or support of people not effective (i.e., the leaders in an area did not demonstrate appropriate personal behaviours with respect to their role in seeking out and supporting those individuals who identify and speak out about safety issues and concerns, or those people affected by an incident).

**Failure to report/learn from events:** one or more similar events has previously occurred, there was a failure to learn from these incidents, e.g., not all events reported or those reported were inadequately investigated or additional control measures identified as required were not effectively implemented.

## APPENDIX 4: Frequently Asked Questions

1. **Work-relatedness/home based workers: If an employee voluntarily takes work home and is injured while working at home, is the case recordable?**

No. Injuries occurring in the home environment are only considered work-related if the employee is being paid or compensated for working at home and the injury is directly related to the performance of the work rather than to the general home environment.

Refer to: OSHA Recordkeeping Policies and Procedures Manual, question 5-7: <https://www.osha.gov/enforcement/directives/cpl-02-00-135>

2. **Work-relatedness/home based workers: How do I decide if a case is work-related when the employee is working at home?**

Injuries that occur while an employee is working at home, including work in a home office, will be considered work-related if the injury occurs while the employee is performing work for pay or compensation in the home, and the injury is directly related to the performance of work rather than to the general home environment or setting.

For example:

- If an employee drops a pile of work documents and injures his or her foot, the case is considered work-related.
- If an employer's fingernail is punctured by a needle from a sewing machine used to perform garment work at home, becomes infected and requires medical treatment, the injury is considered work-related.
- If an employee is injured because he or she trips on the family dog while rushing to answer a work phone call, the case is not considered work-related.
- If an employee working at home is electrocuted because of faulty home wiring, the injury is not considered work-related.

Refer to OSHA Standard 1904.5(b)(7): <https://www.osha.gov/laws-regs/regulations/standardnumber/1904/1904.5>

Note: IOGP does not collect information on illnesses.

3. **Security – Under what circumstances should security related incidents be reported?**

Security related incidents (e.g., fatalities associated with an illegal detention of staff) should be reported where they are work-related, or where there is, or ought to be, management controls in place to reduce the possibility of the incident occurring.

4. **Suicides – Under what circumstances should suicides be reported?**

It is not expected that suicides will be reported. However, if an organization deems it to be work-related, it can be reported using Forms 1 and 2.

5. OSHA vs. IOGP – What are the differences between reporting under the OSHA and IOGP requirements?

OSHA only requires the reporting of company employees (as defined in Appendix 2). The main difference between IOGP and OSHA reporting requirements relates to the need for E&P organizations to report incidents associated with company employees, contractor, and subcontractor personnel to IOGP. Additionally, IOGP encourages the reporting of third party fatalities.

With respect to the classification of injuries, IOGP and OSHA are aligned.

IOGP LTIR and TRIR normalized results are presented per million work hours and FAR is normalized per 100 million hours. In the OSHA reports the incidence rates represent the number of injuries and illnesses per 100 full-time workers (200,000 hours) and are calculated as:

$(N/H) \times 200,000$ , where:

- N = number of injuries and illnesses
- H = total hours worked during the calendar year

IOGP only collects injuries, while OSHA collects both injuries and occupational illnesses.

NB: Definitions and scope change over time and there may be other differences that have not been taken into account here, so this list should **not** be treated as definitive or complete.

# APPENDIX 5: Report forms – guidance only

IOGP Safety Data Report

## REPORT 1 - OCCUPATIONAL INJURIES - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

Total number of fatal incidents involving employee, contractor or 3rd party fatalities:

(This should tally with the number of report 2 worksheets.)

## COMPANY EMPLOYEES

The following data are collected (enter yes/no in appropriate box):

Lost Workday Case (LWDC) Days  
Restricted Workday Cases (RWDCs)

IOGP Safety Data Report

REPORT 2 - FATAL AND/OR ACTUAL PERMANENT IMPAIRMENT (PI) INCIDENTS - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

Incident details

If an incident involves both a PI and a fatality, the narrative for the incident should be reported on the same Report 2 form.  
See <https://www.iogp.org/tipi> for definitions, examples and FAQ.

Was this incident also classified as a Tier 1 Process Safety Event?

Was this incident also classified as a Motor Vehicle Crash?

Was this incident also classified as a Well Control Incident?

If PI, could this incident have realistically resulted in a fatality?

Date of incident (day/month/year):

Time incident occurred:

Number of fatalities

Number of PI

Place of incident (ring one)

Function (ring one):

Incident description:

What went wrong? (main root causes):

Lessons learnt and recommendations to prevent recurrence:

VICTIM INJURY DETAILS - complete a row for all fatalities and permanent impairments. One row per victim. Add new rows where necessary.

## IOGP Safety Data Report

## REPORT 3 - HIGH POTENTIAL EVENTS - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

Please provide maximum of 5 high potential events with the most learning.

## Event details

Was this incident also classified as an Asset Integrity / Process Safety Event? (see Report 6)

Enter 'yes' or 'no'

Was this incident also classified as a Motor Vehicle Crash? (see Report 5)

Enter 'yes' or 'no'

Date of event (day/month/year):

Place of event (ring one):

ONSHORE  
OFFSHORE

Function (ring one):

EXPLORATION  
DRILLING  
PRODUCTION  
CONSTRUCTION  
UNSPECIFIED

Event description:

What went wrong? (main root causes):

Lessons learnt and recommendations to prevent reoccurrence:

Event cause  
(ring one - required)

1. Aviation accident  
2. Assault or violent act  
3. Caught in, under or between (excl. dropped objects)  
4. Confined space  
5. Cut, puncture, scrape  
6. Dropped objects  
7. Explosion, fire or burns  
8. Exposure electrical

9. Exposure noise, chemical, biological, vibration, extreme temperature  
10. Falls from height  
11. Overexertion, strain  
12. Pressure release  
13. Slips and trips (at same height)  
14. Struck by (not dropped object)  
15. Water related, drowning  
16. Unspecified - Other

Type of activity:  
(ring one - required)

1. Construction, commissioning, decommissioning  
2. Diving, subsea, ROV  
3. Drilling, workover, well services  
4. Excavation, trenching, ground disturbance  
5. Lifting, crane, rigging, deck operations  
6. Maintenance, inspection, testing  
7. Office, warehouse, accommodation, catering

8. Production operations  
9. Seismic/survey operations  
10. Transport - Air  
11. Transport - Land  
12. Transport - Water, incl. marine activity  
13. Unspecified - other

Causal factors  
(ring as many as apply)  
See User Guide Appendix 3A

PEOPLE (ACTS)  
Following Procedures:  
1. Deviation intentional (by individual or group)  
2. Deviation unintentional (by individual or group)  
3. Improper position (in the line of fire)  
4. Overexertion or improper position/posture for task  
5. Work or motion at improper speed  
6. Improper lifting or loading  
Use of Tools, Equipment, Materials and Products:  
7. Improper use/position of tools/equipment/materials/products  
8. Servicing of energised equipment/inadequate energy isolation  
Use of Protective Methods:  
9. Failure to warn of hazard  
10. Inadequate use of safety systems  
11. Personal Protective Equipment not used or used improperly  
12. Equipment or materials not secured  
13. Disabled or remove guards, warning systems or safety devices  
Inattention/Lack of Awareness:  
14. Improper decision making or lack of judgment  
15. Lack of attention/distracted by other concerns/stress  
16. Acts of violence  
17. Use of drugs or alcohol  
18. Fatigue

PROCESS (CONDITIONS)  
Protective Systems:  
19. Inadequate/defective guards or protective barriers  
20. Inadequate/defective Personal Protective Equipment  
21. Inadequate/defective warning systems/safety devices  
22. Inadequate security provisions or systems  
Tools, Equipment, Materials, Products:  
23. Inadequate design/specification or management of change  
24. Inadequate/defective tools/equipment/materials/ products  
25. Inadequate maintenance/inspection/testing  
Work Place Hazards:  
26. Congestion, clutter or restricted motion  
27. Inadequate surfaces, floors, walkways or roads  
28. Hazardous atmosphere (explosive/toxic/asphyxiant)  
29. Storms or acts of nature  
Organisational:  
30. Inadequate training/competence  
31. Inadequate work standards/procedures  
32. Inadequate hazard identification or risk assessment  
33. Inadequate communication  
34. Inadequate supervision  
35. Poor leadership/organisational culture  
36. Failure to report/learn from incidents

Primary Life-Saving Rule  
(ring one)  
The applicable rule is the rule that failed  
or was violated by the victim or other individual  
See IOGP report 459

1. Bypassing safety controls  
2. Confined space  
3. Driving  
4. Energy isolation  
5. Hot work

6. Line of fire  
7. Safe mechanical lifting  
8. Work authorisation  
9. Work at height  
10. Other (give details below)

Other applicable Life-Saving Rules  
(ring as many as apply)  
The applicable rule is the rule that failed  
or was violated by the victim or other individual  
See IOGP report 459

1. Bypassing safety controls  
2. Confined space  
3. Driving  
4. Energy isolation  
5. Hot work

6. Line of fire  
7. Safe mechanical lifting  
8. Work authorisation  
9. Work at height  
10. Other (give details below)

IOGP Safety Data Report

REPORT 3A - HIGH POTENTIAL EVENTS - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |

Total number of high potential events for the reporting year.

The applicable rule is the rule that failed or was violated by an individual  
For information on Rules see IOGP report 459.

|                                   |                  | Indicate whether your company uses the rule. |    |            |
|-----------------------------------|------------------|----------------------------------------------|----|------------|
|                                   |                  | Yes                                          | No | Don't know |
| RULE                              | Number of events |                                              |    |            |
| Bypassing safety controls         |                  |                                              |    |            |
| Confined space                    |                  |                                              |    |            |
| Driving                           |                  |                                              |    |            |
| Energy isolation                  |                  |                                              |    |            |
| Hot work                          |                  |                                              |    |            |
| Line of fire                      |                  |                                              |    |            |
| Safe mechanical lifting           |                  |                                              |    |            |
| Work authorisation                |                  |                                              |    |            |
| Working at height                 |                  |                                              |    |            |
| Other issues (give details below) |                  |                                              |    |            |
| Total                             | 0                | 0                                            | 0  | 0          |

Please give details of any issues linked to high potential events that are not assigned to a Life-Saving Rule.

IOGP Safety Data Report

REPORT 4 - MOTOR VEHICLE CRASHES - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

|                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MVC Categories (See IOGP Report 365)                                                                                                                                              |
| Category C – Catastrophic events                                                                                                                                                  |
| 1. Any MVC resulting in one or more company, contractor or subcontractor fatalities or permanent impairments (PI)                                                                 |
| 2. Any MVC resulting in one or more third party fatalities associated with the MVC involving a company, contractor vehicle(s) or subcontractor                                    |
| Category M – Major events                                                                                                                                                         |
| 3. Any MVC resulting in company, contractor or subcontractor injury where the most severe outcome is a Lost Work Day Case (LWDC)                                                  |
| 4. Any MVC resulting in company, contractor or subcontractor vehicle rollover                                                                                                     |
| Category S – Serious events                                                                                                                                                       |
| 5. Any MVC resulting in company, contractor or subcontractor injury where the most severe outcome is a recordable injury (Medical Treatment Case and/or Restricted Work Day Case) |
| Category O – Other events                                                                                                                                                         |
| 6. Any MVC resulting in company, contractor or subcontractor injury where the most severe outcome is a Minor Injury (First Aid Case)                                              |
| 7. Any MVC where company, contractor or subcontractor vehicle cannot be driven from the scene under its own power in a roadworthy state (disabling damage)                        |

Indicate types of incidents for which you have data, even if there were zero incidents.

Where a value is known to be zero enter 0 otherwise leave cell empty.

There should be no double counting, i.e., an MVC leading to fatality and LTI should only be counted as MVC with fatality

If you do not have the breakdown by function, data should be entered in the 'unspecified' row. This way the total row will show the total for each column (distance driven, MVC and fatalities).

\* If you do not have the breakdown by function use the 'unspecified' row so that the total equals the total distance driven.

IOGP Safety Data Report

REPORT 5 - PROCESS SAFETY EVENTS - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

Process Safety Events (PSE), is a lagging indicator based on Loss of Primary Containment (LOPC). There are two "tiers" of PSE. Tier 1 is more severe than Tier 2. By applying the indicator definitions, companies can determine whether an LOPC is a Tier 1 or a Tier 2 PSE. The aim of this report is to collect both Tier 1 and Tier 2 PSE data from member companies using the four tables below. Two of the tables request additional PSE data about the material released and the operational activities, but it is recognised that some of this data may not be readily available within a company's internal reporting system.

The first data table below reports the number of offshore or onshore Tier 1 PSE for both drilling and production. The table also requests that companies report the number of consequences related to their Tier 1 PSE. Note that one PSE can result in multiple consequences, so the total number of consequences reported may equal or exceed the total number of PSE.

In addition to reporting an injury or fatality as a consequence in the "Employee or Contractor Fatality or LWDC" column, the first table also requests data on fatalities that resulted from PSE. Companies should enter the number of PSE that resulted in one or more fatalities, then in the next two columns enter the actual number of fatalities - employees and contractors, or third parties.

The Tier 2 tables should be completed in the same way as the Tier 1 tables, noting that certain categories, such as fatalities, are not relevant for Tier 2.

**EXAMPLE EVENT:** An unintended gas release from a valve (i.e. an LOPC) results in a fire causing damage with an estimated cost of \$10,000 to replace the valve, and also two people are treated for burns from the fire, and the return to work. This counts as one Tier 2 event in the "Total Process Safety Events" column of the Tier 2 table. However, this single event had 2 separate consequences, and is reported in each of the consequence columns of the Tier 2 table below; as 1 PSE causing injury and 1 PSE causing a fire (note the two injuries only count as one PSE causing injury). If the amount of gas released during any hour of the event exceeded the thresholds given in Table 2, then this would add a third consequence for the same PSE, and count as one PSE in the material release column of the Tier 2 table. Note that if the gas released exceeded any of the Table 1 thresholds, then this would be a Tier 1 event.

Events that were caused by sabotage, wilful damage or an equivalent must ONLY be entered in Report 6A.

Note: Changes to definitions and examples published in Report 456 version 3 (2023) are applicable for 2023 data onwards.

| TIER 1   |            |                             | Note: A single PSE may result in multiple consequences; therefore the total of all columns below should equal or exceed Total PSE |                                                        |                                          |                                   |                                        |                                         |                                            |                                                    |                                      |  |

## IOGP Safety Data Report

## REPORT 5A - PROCESS SAFETY EVENTS DUE TO SABOTAGE OR WILLFUL DAMAGE - 2025 DATA

|                    |      |
|--------------------|------|
| Company            | 0    |
| Contact name/title | 0    |
| Year               | 2025 |
| Country            |      |

Process Safety Events (PSE), is a lagging indicator based on Loss of Primary Containment (LOPC). There are two "tiers" of PSE: Tier 1 is more severe than Tier 2. By applying the indicator definitions, companies can determine whether an LOPC is a Tier 1 or a Tier 2 PSE. The aim of this report is to collect both Tier 1 and Tier 2 PSE data from member companies using the four tables below. Two of the tables request additional PSE data about the material released and the operational activities, but it is recognised that some of this data may not be readily available within a company's internal reporting system.

The first data table below reports the number of offshore or onshore Tier 1 PSE for both drilling and production. The table also requests that companies report the number of consequences related to their Tier 1 PSE. Note that one PSE can result in multiple consequences, so the total number of consequences reported may equal or exceed the total number of PSE.

In addition to reporting an injury or fatality in the "Employee or Contractor Fatality or LWDC" column, the first table also requests data on fatalities that resulted from PSE. Companies should enter the number of PSE that resulted in one or more fatalities, then in the next two columns enter the actual number of fatalities - employees and contractors, or third parties.

The Tier 2 tables should be completed in the same way as the Tier 1 tables, noting that certain categories, such as fatalities, are not relevant for Tier 2.

**EXAMPLE EVENT:** A unintended gas release from a valve (i.e. an LOPC) results in a fire causing damage with an estimated cost of \$10,000 to replace the valve, and also two people are treated for burns from the fire, and the return to work. This counts as one Tier 2 event in the "Total Process Safety Events" column of the Tier 2 table. However, this single event had 2 separate consequences, and is reported in each of the consequence columns of the Tier 2 table below; as 1 PSE causing injury and 1 PSE causing a fire (note the two injuries only count as one PSE causing injury). If the amount of gas released during any hour of the event exceeded the thresholds given in Table 2, then this would add a third consequence for the same PSE, and count as one PSE in the material release column of the Tier 2 table. Note that if the gas released exceeded any of the Table 1 thresholds, then this would be a Tier 1 event.

**Use this form to report only events that were caused by sabotage, willful damage or an equivalent. Events reported in this form must not be entered in Report 5**

|                                                                                |            |                             |                                                                                                                                   |                                                        |                                          |                                   |                                        |                                         |                                            |                                                    |                                      |

| For releases of duration greater than one hour, what was the maximum quantity released in any one hour period of the release duration? Liquid releases can be reported as mass (kg or lb) or volume (bbl), but gas releases should be reported as mass (kg or lb). |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Process safety events are categorized by the maximum quantity released in any one hour period of the release duration. If the duration of the release is less than 1 hour, the total quantity released is used. |
| How much was released in total? Report in mass units not volume. Include units.                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                 |
| Please explain why it has been classified as a Tier 1 PSE.                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                 |

REPORT 5B - TIER 1 PSE REPORT

Incident category:

(ring at least one and all that apply)

1. An employee, contractor or subcontractor 'days away from work' injury and/or fatality
2. A hospital admission and/or fatality of a third party
3. An officially declared community evacuation or community shelter-in-place including precautionary community evacuation or community shelter-in-place
4. A fire or explosion damage greater than or equal to \$100,000 of direct cost
5. An engineered pressure relief (e.g., use of a pressure relief device (PRD), safety instrumented system (SIS), or manually initiated emergency depressurisation) discharge of a quantity greater than or equal to the threshold quantities in Report 456 Part E in any one 1-hour period, to atmosphere whether directly or via a downstream destructive device that results in one or more of the following four consequences. The threshold quantity determination is made at the discharge of the engineered PRD, while the consequence is determined when the material reaches atmosphere whether directly or via a downstream destructive device:
  - rainfall
  - discharge to a potentially unsafe location
  - an on-site shelter-in-place or on-site evacuation, excluding precautionary on-site
  - shelter-in-place or on-site evacuation
  - public protective measures (e.g., road closures) including precautionary public protective measures
6. An upset emission from a permitted or regulated source, of a quantity greater than or equal to the threshold quantities in Part E in any one-hour period, that results in one or more of the following four consequences:
  - rainfall
  - discharge to a potentially unsafe location
  - an on-site shelter-in-place or on-site evacuation, excluding precautionary on-site
  - shelter-in-place or on-site evacuation
  - public protective measures (e.g., road closures) including precautionary public protective measures
7. An engineered release of material greater than or equal to the threshold quantities described in Part E in any one-hour period, excluding engineered pressure-relief discharges and upset emissions from permitted or regulated sources.

Type of activity:

(ring one - required)

1. Drilling
  2. Completions
  3. Intervention/Well services
  4. Production operations
  5. Pipeline operations
  6. Unspecified - other
- Explain Other:

Mode of Operation:

(ring one - required)

- Production
1. Start-up
  2. Planned shutdown
  3. Emergency shutdown
  4. Normal
  5. Upset
  6. Turnaround
  7. Routine maintenance
  8. Temporary
  9. Other production
- Drilling and Completion Operations
10. Drilling
  11. Completion
  12. Well intervention / Well servicing
  13. Well flow testing
  14. Abandonment
  15. Recompletion

Note: Changes to definitions and examples published in Report 456 version 3 (2023) are applicable for 2023 data onwards.

Note - Non-toxic and non-flammable materials (e.g. steam, hot water, nitrogen, CO<sub>2</sub> and compressed air) have no threshold quantities and are only included in this definition as a result of their potential to result in one of the other consequences.

|                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## IOGP Safety Data Report

**REPORT 6 - WELL CONTROL INCIDENTS - 2025 DATA**

|                    |      |  |  |  |
|--------------------|------|--|--|--|
| Company            | 0    |  |  |  |
| Contact name/title | 0    |  |  |  |
| Year               | 2025 |  |  |  |
| Country            |      |  |  |  |

WCI reporting categories - see IOGP Report 660 - *Well Control Incident Definitions*, August 2025 (<https://www.iogp.org/bookstore/product/well-control-incident-definitions>)

**WCI Level 1 – Loss of well control**

A failure of the well barrier envelopes resulted in uncontrolled flow from the well to surface, seabed, or, via underground communication, to another formation or well.

**WCI Level 2 – Complicated well control**

One or more well barrier envelopes failed. The remaining well barrier envelope still had pressure integrity but may have been degraded, operated outside its design capacity, or complications resulted in escalation of the response. Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.

**WCI Level 3 – Routine well control**

One or more well barrier envelopes failed. A single planned and tested barrier envelope remained. The remaining well barrier envelope operated within its design capacity and has operated as expected. Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.

**WCI Level 3 – Managed Pressure Drilling (MPD) Influx Management**

An unplanned influx that is controlled within the normal functioning and operating limit of the MPD system. Any influx due to a failure of procedures, including planning, people, or equipment, or if the secondary well barrier has been activated, is a WCI Level 3 – Routine WCI.

**WCI Level 4 – Near miss or potential well control incident**

An incident, including a near miss, that had the potential to escalate and/or could have resulted in the failure of a well barrier envelope.

Enter the number of well control incidents in the reporting year

Where a value is known to be zero enter 0 otherwise leave cell empty.

Note: Changes to definitions in Report 660 (Level 3 MPD) are applicable from 2025 data onwards.

Changes to definitions and examples published in Report 456 version 3 (2023) are applicable for 2023 data onwards.

For each Level 1 and Level 2 and Level 3 and Level 3 (MPD), please provide details by filling a REPORT 6A tab (one per incident)

Please provide descriptive information in the proper box for the purpose of validating the classification. Volumes and fluid composition are not required. The description requested in the shaded boxes are for validation purposes only and will not be published or used for data analysis.

If it was Level 1 WCI, please explain why.

If it was Level 2 WCI, please explain why.

If it was a Level 3 WCI, please explain why. Reporting of Level 3 WCI is optional.

If it was a Level 3 MPD WCI, please explain why. Reporting of Level 3 WCI is optional.

**EXAMPLES AND EXPLANATION/GUIDANCE**

Incidents that fit the criteria for both PSE and WCI should be reported in both forms.

*Level 1 WCI - Loss of Well control. A failure of the well barrier envelopes resulted in uncontrolled flow from the well to surface, seabed, or, via underground communication, to another formation or well.*

*Level 2 WCI - Complicated well control. One or more well barrier envelopes failed. The remaining well barrier envelope still had pressure integrity but may have been degraded, operated outside its design capacity, or complications resulted in escalation of the response. Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.*

*WCI Level 3 – Routine well control  
One or more well barrier envelopes failed. A single planned and tested barrier envelope remained. The remaining well barrier envelope operated within its design capacity and has operated as expected. Any flow period from the well was temporary, i.e., the well flowed only while planned procedures were immediately implemented.*

*WCI Level 3 – Managed Pressure Drilling (MPD) Influx Management  
An unplanned influx that is controlled within the normal functioning and operating limit of the MPD system.  
Any influx due to a failure of procedures, including planning, people, or equipment, or if the secondary well barrier has been activated, is a WCI Level 3 – Routine WCI.*

Was the incident also a PSE?

- ☐ Yes  
☐ No

Was the incident also an oil or chemical spill?

- ☐ Yes  
☐ No

Category of incident (ring one):

- Level 1  
Level 2  
Level 3  
**Level 3 MPD**

Date of incident (day/month/year):

Time incident occurred (or time of day):

Number of company fatalities

Number of contractor fatalities

Number of 3rd party fatalities

Number of RWDC

Number of LWDC

Place of incident (ring one)

- ONSHORE  
OFFSHORE

Incident description:

What went wrong? (main root causes):

Lessons learnt and recommendations to prevent reoccurrence:

Type of activity:  
(ring or highlight)

1. Drilling  
2. Completion  
3. Well intervention/Well servicing  
4. Well flow testing  
5. Recompletion  
6. Abandonment  
7. Other  
Explain Other:

**Note: Changes to definitions and examples published in Report 456 version 3 (2023) are applicable for 2023 data onwards.**

|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Incident description: | At a land rig site, a load (coiled tubing reel) fell from a mobile crane during a truck loading operation. The contracted truck driver was standing close to the rear of the truck trailer during the lifting operation. He was waiting to place wooden chocks behind the reel to secure the load for transport. The truck was parked on a slight slope. When the slings failed the reel fell onto the trailer, rolled off the end of the trailer and impacted the truck driver in the head and chest, resulting in fatal injuries. |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| What went wrong? (main root causes): | The coiled tubing reel should have been in a cradle for transport, no cradle was available, so the crew decided to use wooden batons to try to chock the reel for transport, thinking that other items to be loaded would also help secure the reel during transport. The truck driver had been driving for his maximum hours and as fatigued after reaching the remote land rigsite, he had been keen to load his truck late at night, so that he could leave early the next morning when he had completed his mandatory rest hours. The truck was parked on a slope, this was the most convenient place to load the reel to avoid having to move the mobile crane. As the loading operation was conducted late at night and in a rush before the end of the mobile crane operator's shift ended, barriers were not put up to mark the red zone. This also influenced the truck driver's decision not to lift and secure the tailgate of the trailer. No-one in the lift crew checked the load rating of the slings before the lift, the slings used were not rated to lift the reel. Due to a lack of lighting in the area, the mobile crane operator could not see the position of the truck driver, who also did not have reflective strips on his coveralls. |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lessons learnt and recommendations to prevent recurrence: | All reels must be lifted in the transport cradles designed to secure the reel during transport (change from lifting plan was not adequately managed). Red zone barriers must be used to indicate the safe distance from the crane lift. All personnel on location are required to have reflective clothing. Lift planning controls to be re-enforced for all operations, including inspection of slings for rating acceptable for the load and any signs of damage. Lifting operations must not be conducted outside of designated loading areas e.g. where lighting is inadequate or trucks are required to be parked on a slope. All personnel involved in designated lifting operations should be well rested and competent to conduct their assigned tasks, all other personnel must be kept outside the designated and barrierred red zone area. |

## APPENDIX 7: Process safety events – point of release

Additional definitions of the keyword categories for point of release are provided below.

### **The category piping in process and utility systems (excluding subsea) – includes:**

- Piping joint, including both flanged and other connection methods e.g., clamp/hub connectors.  
Excludes: flange joints at nozzle of equipment item as these are assigned to the equipment item.
- Piping material/tubing, excluding fittings or connections e.g., valves, flanged joints, flare/vent system piping, instrumentation and instrumentation tubing.
- Valve (body, stem, plugs) excluding flanges joints on main inlet/outlet.
- Choke.
- Instrumentation and small-bore tubing, including instrument tubing, tappings, pressure transmitters, sight glasses, small bore tubing and associated fittings e.g., connections, valves.
- Sightglass, excluding onshore flowlines after they leave the well pad as these are classified as onshore flowline under onshore pipelines/flowlines.
- Platform/well pad flowline, including joints to fixed equipment, flexible piping or bellows, loading/unloading hoses.
- Flexible hose/piping including the vessel itself and fittings e.g., covers/hatches not covered by piping systems up to the first flange connection on the vessel nozzles, including vessel and finger-type slug-catchers.  
Excludes: pressure vessels used for storage e.g., LPG bullets and spheres.

### **The category of equipment includes the following:**

- Pressure vessels – similar to vessels.
- Pig launcher/receiver, including the seal(s) as well as other part of equipment item.
- Pumps, including the seal(s) as well as any other part of equipment item.
- Compressor/ blower/fan including any equipment on metering and prover loops.
- Meter including the filter unit and filter but excluding piping connections beyond inlet and outlet nozzles.
- Filters, includes incidents with fired heaters, including internal tubing failures.
- Fired heater/boiler/furnace, including temporary and permanent power generation units but excluding piping external to the unit connecting it to other services.
- Power generation unit – similar to vessels.
- Reactor, including incidents with non-fired heaters, including internal tubing failures.
- Heat exchangers, including incidents involving direct releases from atmospheric tanks (e.g., floor and wall, hatches, P&V valves) or other incidents such as lightning strikes, rim seal fires, sunken roofs etc. Also includes FPSO/ FSO storage tanks. Includes ambient and refrigerated storage, above and below ground. Excludes overflow incidents, tank instrumentation and drainage tanks.

**The category tanks/sumps and pits includes:**

- Atmospheric tank, including incidents caused by both human error and/or equipment failures.
- Atmospheric tank overflow, including LPG storage bullets and spheres, LNG storage tanks, above and below ground.  
Excludes: slugcatchers (as these are included in vessels).
- Pressurized storage vessel, including both permanent sumps and bunds as well as permanent or temporary pits e.g., well test pits.
- Sump or pit overflow, excludes upstream or downstream piping and flange connections to the valve, P&V valves and emergency hatches on tanks.

**The category relief, vent and drainage systems includes:**

- Relief valve (body, plugs) including liquid carryover events in flare/atmospheric vent systems. Excludes: P&V valves and emergency hatches on tanks, releases from flare knock-out drums.
- Flare and atmospheric vent systems (intended discharge location).
- Flare and atmospheric vent systems (not at intended discharge location).  
Excludes: human error type incidents which are included in the category “breaking containment location”.
- Drain including produced water discharge route to sea.
- Discharge to sea, including incidents that occur during the process of breaking containment (with or without a permit to work (PTW)).

**The category breaking containment locations includes:**

- Breaking containment location, including road tanker loading/ unloading, marine vessel loading/ unloading (including loading arms) and buoys as well as all materials (e.g., oil, LPG, LNG, condensate).  
Excludes: Loading/ unloading hoses.
- Loading/unloading coupling.
- Sample system, including incidents where vent, bleed or drain valves are left in the wrong position as part of a work activity e.g., start up after maintenance.
- Piping/ valve (inadvertently left) open to atmosphere, including land or platform-based wells. Excludes equipment downstream of the well choke.

**The category wells, drilling and intervention includes:**

- Well.  
Excludes: equipment downstream of the well choke.
- Subsea well, including well intervention/drilling equipment attached to a well.
- Well intervention equipment, excludes: the well itself.
- Mud circuit/ tanks, including subsea flowlines, risers (including non-subsea section above the splash zone), pipelines and umbilicals up to manifolds at well clusters.

**The category subsea includes:**

- Subsea pipeline/ flowline, including subsea equipment (piping, manifolds, jumpers, connections, valves etc.), except for subsea flowlines or pipelines and the wells themselves.
- Subsea equipment includes fittings (e.g., flanges, valves) on pipelines.

**The category onshore pipelines/flowlines includes:**

- Onshore pipeline, including onshore flowlines that extend away from a well pad and join a manifold some distance away. Onshore flowlines that join a manifold at or local to a well pad are classified under flowline in piping systems.
- Onshore flowlines, this category is intended for onshore flowlines that extend away from a well pad and join a manifold some distance away. Onshore flowlines that join a manifold at or local to a well pad are classified under flowline in piping systems.
